# General Product Information

## Introduction

The Steel Network provides solutions for all standard light steel framing configurations. Substantial effort has been made by the industry to standardize construction practices to ensure the positive connections of light steel framing components. Toward this end, TSN products have undergone extensive field and laboratory testing to achieve complete solutions for both designers and installers.

- Attachment of connections to the primary structure should be engineered by a design professional. Listed allowable loads are based on tests with full attachment to primary structure through all guide holes where applicable.
- Prying action on the attachment to the structure should be considered where eccentricity exists between the fastener and the load.
- Test reports are available through The Steel Network, Inc. Contact TSN at (888) 474-4876 for more information.
- The Steel Network, Inc. offers all products and services through local authorized distributors.
- Products are manufactured from recycled steel.
- The installation contractor is responsible for installing products in accordance with the instructions listed in this catalog and included with the shipped product, in addition to any relevant specifications and building codes. Install connectors prior to loading.
- Custom products are available upon request. Prior approval must be obtained and the order shall be submitted with a signed engineered drawing.
- Allowable loads and material data listed in this catalog supersede all information in all earlier publications.
- Self-drilling screws should be installed perpendicular to the work surface. #8 and #10 self-drilling screws should be installed with a screw gun limited to no more than 2,500 rpm. #12 self-drilling screws should be installed with a screw gun limited to no more than 1,800 rpm.
- The screw gun must also feature a torque limiting nose piece to avoid over-driving the screw. Over-driving can damage the fastener by stripping the threads or shearing the fastener head and may cause failure even when not visually detected.
- Allowable loads have not been increased for wind, seismic, or other factors.
- Loads are determined using "Allowable Stress Design" (ASD) method. When LRFD (Load and Resistance Factor Design) is utilized, contact TSN for appropriate resistance values.
- Products are tested according to the guidelines listed in the AISI S100 Specification for the Design of Cold Formed Steel Structures, Section K, and ICC Criteria AC261, where applicable.
- Allowable loads are based on the lesser of: (a) Average test ultimate load divided by the appropriate factor of safety, (b) Load producing deflection value of 0.125" for vertical deflection products and 0.1875" or drift products, or (c) Fastener/screw allowable load between the clip & stud.
- Allowable loads are the result of static testing by either independent testing facilities or in-house testing and calculations.
- Allowable loads are the maximum forces resisted in one direction only. When multiple loads effect a connection: Designer of record is responsible for checking the interaction of multiple loads acting on a connection.
- Screw connection allowable loads are based on AISI-S100 design specification, Sec. J4, and are limited by these allowable loads: 717 lbs for #12 Shear, 548 lbs for #10 Shear, 400 lbs for #8 Shear, 494 lbs for #12 Pullout, 435 lbs for #10 Pullout, 375 lbs for #8 Pullout.
- Where screw torsion is considered, it is assumed that half of the torsional moment is taken by the connection to the structure and half is taken by the connection to the stud, unless stated otherwise.

# SteelSmart System 8

**With 2021 IBC & ASCE 7-16**

The industry's **#1 tool** for the design of  
Connections, Members, Fasteners & Details

**COMPONENT DESIGN MODULES:**

- Curtain Wall
- Load Bearing Wall
- X-Brace Shear Wall
- Floor Framing
- Roof Framing & Trusses

# Building Load Paths

## Introduction

### Background

There are two types of light steel framing connections, fixed and movement-allowing. Fixed connections of framing members are found in many types of assemblies, including axial-load-bearing walls, curtain walls, trusses, roofs, and floors. As light steel framing (LSF) assemblies are only as strong as their weakest component, The Steel Network has developed products to provide designers and installers with tested, certified, and traceable materials for light steel framing assemblies.

Tracing a consistent load and movement path from the roof to the foundation is much simpler through use of The Steel Network's connectors. TSN products are engineered to provide the most efficient load transfer path for the designer while adding economic value for the contractor.

When considering safety and liability, connections should not be the weakest part of the assembly. Use of generic material raises questions about performance. Is the steel material traceable? Is the material sufficiently galvanized? Has the material been structurally load tested? These questions should not go unanswered in today's construction practice. The Steel Network provides mill certified and tested steel, galvanized with coating meeting or exceeding industry standards. TSN products have undergone extensive field and laboratory testing to achieve complete solutions for both designers and installers, enabling them to trace the most efficient load and movement paths through the structure. When it comes to connections and members, TSN is setting the industry standard.

### Load Directions

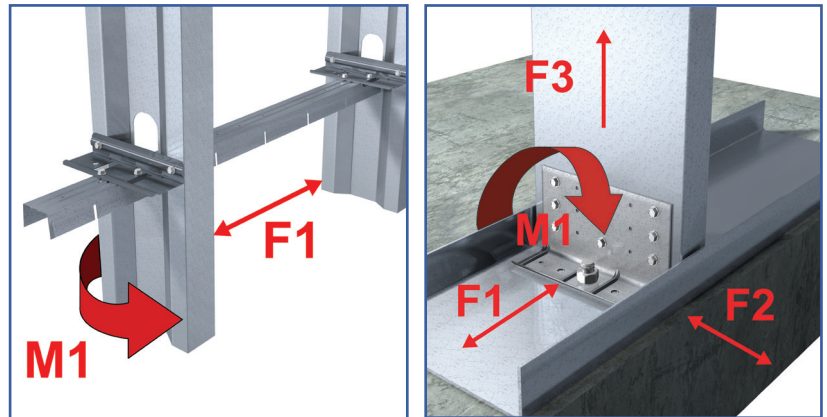

Connection loads have been determined through structural testing based on guidelines set forth by the AISI Specification. A diagram of load directions for each clip is located with the respective product load tables. Load direction nomenclature is consistent throughout this catalog. The diagrams at right illustrate examples of load directions used in this catalog.

**F1** = Lateral (In the plane of the wall), lbs

**F2** = Horizontal Load (Out of the plane of the wall), lbs

**F3** = Vertical Load (or Uplift), lbs

**M1** = Moment-Carrying (or Rotational), in-lbs

In addition, connectors are available to resist axial tension and compression in a flat plane.

### Industry Improvements

The Steel Network's series of connectors utilizes tested, mechanical configurations to resist many different types of load (gravity, in-plane, out-of-plane, moment-carrying, axial tension and compression in a flat plane). Each is available in a wide range of sizes and applications to meet all standard construction needs. Additionally, custom clips may be designed and produced for specific applications.

The Steel Network delivers a comprehensive improvement to the industry by:

- Providing simple, labor-saving solutions for all steel framing attachments to primary frames.
- Placing pre-drilled guide holes for quick and accurate fastener placement.
- Producing connections tested under AISI guidelines.
- Manufacturing from ASTM A1003 steel with hot-dipped galvanized G90 coating guaranteeing longterm durability and performance.
- Eliminating use of untested, untraceable, steel for connections.

### Stiffened Plate Elements

Most TSN connection products are manufactured with stiffeners, as bending forces are present when loads are transferred from the framing member to the structure. Stiffeners increase the capacity of flat elements to resist bending, thus maximizing material efficiency.

# Movement-Allowing Connectors

## Introduction

### Primary Structural Deflection

All structures deflect vertically. To prevent non-axial-load-bearing studs from carrying the weight of the structure and to protect finishes, vertical deflection connections should be incorporated at the earliest possible moment of project design. The load-carrying capacity of a steel stud in bending is reduced significantly when adding an axial force propagated by the bending of a primary beam or slab. VertiClip® products were developed to prevent the crushing effect on non-axial-load-bearing wall studs. Non-axial-load-bearing wall studs include exterior curtain wall and interior wall assemblies. When project conditions dictate, lateral drift and vertical deflection may be accommodated through utilization of TSN's DriftClip® and DriftTrak® lines of connectors.

Finished walls frequently experience cracking, buckling, or crushing due to improper isolation of building movement. The movement of the primary building structure is largely accounted for in horizontal member live loading. In addition to live loads, wind, seismic forces, moisture content in materials, and temperature cycles all contribute to movement. The incorporation of vertical deflection connections during the working drawing phase will eliminate the liability of failures and added costs associated with wall system installation.

### Specifying Deflection Distances

Deflection distances are determined from movement of the primary frame, roof, and floor slab. Designers of non-axial-load-bearing framing typically allow for a minimum of 1/2" (13mm) of vertical deflection. When specifying vertical deflection distances, consider the following example -- the deflection distance may be derived using a column spacing of 20 feet on center and a maximum deflection of L/480, thereby resulting in a vertical deflection value equal to .5". Deflection distances may range from 0.125" in very heavy rigid structures to 6" in lightweight open frames.

## Step Bushing Technology®

### Innovation

#### Shear Transfer

Non-axial-load-bearing walls are not designed to carry the structure, but horizontal loads from wind and seismic forces are transferred from the exterior finishes through wall framing to the primary structure. VertiClip and DriftClip effectively transfer the shear load from the stud to the primary member by connecting to the stud web.

The image on the right illustrates the horizontal load path. The load transitions into shear at the VertiClip to stud web attachment. VertiClip prevents the track flange from bending and stiffens the stud web.

#### Step Bushing Technology®

Step Bushing Technology provides a solid and simple solution for accommodating vertical deflections in the primary structural components of a building. Step bushings are pre-installed at the center of elongated slots in the connectors to allow for this vertical movement. A VertiClip or DriftClip attaches mechanically to the stud web through the Step Bushings with self-drilling screws provided with each clips.

The Step Bushing allows horizontal loads to transfer from the stud web into the structure through a positive, mechanical attachment, while simultaneously allowing friction-free vertical movement. TSN's solutions replace friction-held configurations and flange gripping devices, further reducing liability concerns.

VertiClip SLB showing Step Bushings, which are pre-installed at the center of each slot and placed in position at the factory for quality assurance and ease of installation.

Step Bushings transfer the shear load at the stud web through connector into the primary structure.

Step Bushings are seated inside slots of the VertiClips. Since Step Bushings are slightly thicker than the steel material, they provide a positive mechanical attachment to the stud web and allow for deflection movement.

# VertiTrack® VTD

Interior Head of Wall

### Material Composition

**Clip Material:** ASTM A1003/A1003M Structural Grade 50 (340) Type H, ST50H (ST340H): 50ksi (340MPa) minimum yield strength, 65ksi (450MPa) minimum tensile strength, 33mil minimum thickness (20 gauge, 0.0346" design thickness) with ASTM A653/A653M G60 (Z180) hot dipped galvanized coating.

**Track Material:** ASTM A1003/A1003M Structural Grade 33 (230) Type H, ST33H (ST230H): 33ksi (230MPa) minimum yield strength, 45ksi (310MPa) minimum tensile strength, 33mil minimum thickness (20 gauge, 0.0346" design thickness) with ASTM A653/A653M G60 (Z180) hot dipped galvanized coating.

US Patents #5,467,566 & #5,906,080

The attachment of VertiTrack VTD to the primary structure may be made with PAFs or screw/bolt anchors and is dependent upon the base material (steel or concrete) and the design configuration.

### Load Direction

### Notes:

1. VertiTrack VTD loads are the same as VertiClip SLD.
2. VertiTrack VTD is assembled with the VertiClip SLD pre-attached at 16" o.c. or 24" o.c.
3. VertiTrack VTD is designed to support horizontal loads, and should not be used in axial load-bearing walls.
4. Allowable loads have not been increased for wind, seismic, or other factors.
5. Strengthening ribs are present in 3-5/8" and 6" sizes.
6. #8 screws are provided with each step bushing for attachment to the stud web.
7. Fasten through each Verticlip SLD to structure.
8. Fasten within 3/4" of the angle heel (centerline of the 1-1/2" leg) to minimize eccentric load transfer.
9. Total vertical deflection of up to 1-1/2" (3/4" up and 3/4" down). Deflection requirements greater than 3/4" (up and down) are available. Custom spacing is also available.
10. For LRFD strengths contact TSN technical services.

**Nomenclature**

VertiTrack VTD is manufactured in 12 ft. lengths. VertiTrack is designated by type (VTD), followed by stud depth in inches multiplied by 100 and the stud spacing.

**Example:** 6" deep stud, 16" on center  
**Designate:** VertiTrack® VTD600-16

# VertiClip® SLD

Interior Head of Wall

### Material Composition

ASTM A1003/A1003M Structural Grade 50 (340) Type H, ST50H (ST340H): 50ksi (340MPa) minimum yield strength, 65ksi (450MPa) minimum tensile strength, 33mil minimum thickness (20 gauge, 0.0346" design thickness) with ASTM A653/A653M G60 (Z180) hot dipped galvanized coating.

The attachment of VertiClip SLD to the primary structure may be made with PAFs or screw/bolt anchors and is dependent upon the base material (steel or concrete) and the design configuration.

US Patents #5,467,566 & #5,906,080

### VertiClip SLD Allowable (Unfactored) Loads¹

<b>Maximum Allowable Clip Load</b>	<b>51</b>	<b>159</b>	<b>359</b>	<b>405</b>	<b>682</b>

### Load Direction

### Notes:

1. VertiClip SLD is designed to support horizontal loads, and should not be used in axial load-bearing walls.
2. Allowable loads have not been increased for wind, seismic, or other factors.
3. Strengthening ribs are present in 3-5/8" and 6" sizes.
4. #8 screws are provided with each step bushing for attachment to the stud web.
5. Guide holes for attachment to structure are 0.141" diameter for SLD362/400 and SLD600. Guideholes are not standard for other clip sizes.
6. Fasten within 3/4" of the angle heel (centerline of the 1-1/2" leg) to minimize eccentric load transfer.
7. Total vertical deflection of up to 1-1/2" (3/4" up and 3/4" down). Deflection requirements greater than 3/4" (up and down) are available
8. For LRFD strengths contact TSN technical services.

### Nomenclature

VertiClip SLD is designated by type (SLD), followed by stud depth in inches multiplied by 100.

**Example:** 6" stud  
**Designate:** VertiClip® SLD600

### Shaft Wall

VertiClip SLD may be used in shaft wall assemblies to provide a positive attachment at the top of wall. Sizes include VertiClip SLD150, SLD250, and SLD362 for 2.5", 4", and 6" shaft wall stud depths.

UL2079 & UL®-Classified  
WR Grace shaft wall  
assembly HW-D-0401.

Table Notes:

- SLD considered for use on 43 mil or thinner sections
- A load factor of 0.7 is used for deflection determination
- SL\* means a single standard stud will not work. A wider flange wall stud (2" or 2.5" flange) is needed
- All connections can be made with use of 2 screws

### Notes:

1. VertiClip SLS is designed to support horizontal loads, and should not be used in axial load-bearing walls.
2. Allowable loads have not been increased for wind, seismic, or other factors.
3. Return lip added for clips longer than 20".
4. #12 screws are provided with each step bushing for attachment to the stud web.
5. Minimum 3" of SLS required for attachment to steel structure and minimum 5-1/2" for attachment to concrete structure.
6. Fasten within 3/4" of the angle heel (centerline of the 1-1/2" leg) to minimize eccentric load transfer.
7. Total vertical deflection of up to 1-1/2" (3/4" up and 3/4" down). Deflection requirements greater than 3/4" (up and down) are available.
8. Allowable load tables incorporate eccentric loading of fasteners. Values with welded connection may increase.
9. For LRFD strengths contact TSN technical services.

### Load Direction

**Nomenclature**

VertiClip SLS is designated by stud depth and clip length required. Clip length includes a minimum of 3" for steel (5.5" for concrete) of clip material for attachment to structure added to stud depth, plus the distance of the stud from the structure.

**Example:** 6" stud, 6" tolerance, 3" to structure

**Designate:** VertiClip® SLS600-15

\* Use of strengthening ribs and return bends varies with each clip.

**Example Details**

Return lip added for clips longer than 20" (up to 36")

VertiClip SLS at jamb (studs facing each other).

# VertiClip® SLB

Bypass Slab

## Material Composition

ASTM A1003/A1003M Structural Grade 50 (340) Type H, ST50H (ST340H): 50ksi (340MPa) minimum yield strength, 65ksi (450MPa) minimum tensile strength, 68mil minimum thickness (14 gauge, 0.0713" design thickness) with ASTM A653/A653M G90 (Z275) hot dipped galvanized coating.

The attachment of VertiClip SLB to the primary structure may be made with PAFs, screw/bolt anchors or weld and is dependent upon the base material (steel or concrete) and the design configuration.

US Patents #5,467,566 & #5,906,080

## VertiClip SLB Allowable (Unfactored) Loads¹

97mil (12ga), 50ksi Stud	226	226	226	118	118	1,434	1,434	1,600	933	933
<b>Max Allowable Clip Load</b>	<b>226</b>	<b>226</b>	<b>226</b>	<b>118</b>	<b>118</b>	<b>1,600</b>	<b>1,600</b>	<b>1,600</b>	<b>933</b>	<b>933</b>

## Notes:

1. VertiClip SLB is designed to support horizontal loads, and should not be used in axial load-bearing walls.
2. Allowable loads have not been increased for wind, seismic, or other factors.
3. Use of strengthening ribs and return bends vary with each clip.
4. #12 screws are provided with each step bushing for attachment to the stud web. Load requirements do not always justify the use of a third screw.
5. Guide holes for attachment to structure are 0.172" diameter for SLB250, SLB362/400, SLBXXX-10, SLBXXX-12, SLB1000, and SLB1200. Guideholes are 0.141" diameter for SLB600 and SLB800.
6. Fasten within 3/4" of the angle heel (centerline of the 1-1/2" leg) to minimize eccentric load transfer.
7. Total vertical deflection of up to 2" (1" up and 1" down). Deflection requirements greater than 1" (up and down) are available.
8. Allowable load tables incorporate eccentric loading of fasteners. Values with welded connection may increase.
9. Fasteners attaching clip to structure should be installed symmetrically around the center line of the clip. The allowable load of the clip may be reduced if fasteners are not installed symmetrically.
10. Three slots are standard in 6" and higher web depths to accommodate construction tolerances. Use of a third screw and bushing is dependent upon load configuration. 250 and 362/400 sizes have only two slots and two screws.
11. For LRFD strengths contact TSN technical services.

## Load Direction

## Nomenclature

VertiClip SLB is designated by multiplying stud depth by 100.

**Example:** 6" stud.

**Designate:** VertiClip® SLB600

\* Use of strengthening ribs and return bends varies with each clip.

\*\* The VertiClip SLB600-10 and 600-12 accommodate an even greater construction tolerance of studs from structure.

The VertiClip SLB600-10 is 10" in depth and the VertiClip SLB600-12 is 12" in depth with slot spacings designed for a 6" stud

## Example Details

Standard offset of a stud from the heel of a clip should not exceed 1.0". Step bushings and screws may be installed in the middle and outer slots of SLB600 or 800 to accommodate greater building tolerances. Note that this may affect the F1 and F2 allowable load capacity and may require a row of bridging at a maximum distance of 12" of the connection to resist stud torsional effects. Call TSN Tech Support for test data and recommendations.

The VertiClip SLB600-10 and 600-12 accommodate an even greater construction tolerance of studs from structure and are now standard products. The VertiClip SLB600-10 is 10" in depth with slot spacing designed for a 6" stud, and the VertiClip SLB600-12 is 12" in depth with slot spacing designed for a 6" stud.

# VertiClip® SLB-HD

Bypass Slab for Seismic Conditions

The Steel Network, Inc.   
 www.steelnetwork.com  
 1-888-474-4876

### Material Composition

ASTM A1003/A1003M Structural Grade 50 (340) Type H, ST50H (ST340H): 50ksi (340 MPa) minimum yield strength, 65ksi minimum tensile strength, 68mil minimum thickness (14 gauge, 0.0713" design thickness) with ASTM A653/653M G90 (Z275) hot dipped galvanized coating.

The attachment of VertiClip SLB-HD to the primary structure may be made with screw/bolt anchors or weld and is dependent up the base material (steel or concrete) and the design configuration.

### VertiClip SLB-HD Allowable (Unfactored) Loads\*

US Patent # 5,906,080

VertiClip® SLB-HD, Recommended Allowable Load (lbs): F1 & F2						
Screw Patterns with #12 Screws	F1 - Load Direction		F2 - Load Direction with (2) 1/4" Concrete Anchors		F2 - Load Direction with (1) 1/2" Concrete Anchor	
	w/2 #12 Screws	w/3 #12 Screws	w/2 #12 Screws	w/3 #12 Screws	w/2 #12 Screws	w/3 #12 Screws
33mil (20ga), 33ksi Stud	95	95	376	564	376	564
43mil (18ga), 33ksi Stud	124	124	560	840	560	840
54mil (16ga), 33ksi Stud	156	156	788	1,182	788	1,003
54mil (16ga), 50ksi Stud	225	225	1,138	1,187	1,003	1,003
68mil (14ga), 50ksi Stud	234	234	1,187	1,187	1,003	1,003
97mil (12ga), 50ksi Stud	234	234	1,187	1,187	1,003	1,003
<b>Maximum Allowable Clip Load</b>	<b>234</b>	<b>234</b>	<b>1,187</b>		<b>1,003</b>	

### Notes:

1. VertiClip SLB600-HD is designed to support horizontal loads, and should not be used in axial load-bearing walls.
2. Allowable loads have not been increased for wind, seismic, or other factors.
3. #12 screws are provided with each step bushing for attachment to the stud web. Load requirements do not always justify the use of a third screw.
4. Guide holes for attachment to structure are 0.375" diameter for (2) 1/4" concrete screws, and 0.625" diameter for (1) 1/2" concrete anchor.
5. Fasten within 3/4" of the angle heel (centerline of the 1-1/2" leg) to minimize eccentric load transfer.
6. Total vertical deflection of up to 2" (1" up and 1" down).
7. Loads listed reflect force in a single direction. When multiple loads act on the connection, it is the responsibility of the designer to check the interaction of the forces.
8. The recommended allowable load is for the clip and attachment to the stud only. The design professional must design the attachment to the primary structure.
9. For LRFD strengths contact TSN technical services.

### Load Direction

### Nomenclature

VertiClip SLB-HD is designed to be used with 6" studs and is designated VertiClip® SLB600-HD

# VertiClip® SLF

*Bypass Top of Slab*

## Material Composition

ASTM A1003/A1003M Structural Grade 50 (340) Type H, ST50H (ST340H): 50ksi (340 MPa) minimum yield strength, 65ksi (450 MPa) minimum tensile strength, 68mil minimum thickness (14 gauge, 0.0713" design thickness) with ASTM A653/653M G90 (Z275) hot dipped galvanized coating.

The attachment of VertiClip SLF to the primary structure may be made with PAFs, screw/bolt anchors or weld and is dependent upon the base material (steel or concrete) and the design configuration.

US Patent # 8,511,032

## VertiClip SLF Allowable (Unfactored) Loads<sup>1</sup>

VertiClip® SLF, Recommended Allowable Load (lbs): F2	
Screw Patterns with #12 Screws	F2 - Load Direction w/2 #12 screws
43mil (18ga), 33ksi Stud	281
43mil (18ga), 50ksi Stud	326
54mil (16ga), 33ksi Stud	401
54mil (16ga), 50ksi Stud	465
68mil (14ga), 50ksi Stud	632
97mil (12ga), 50ksi Stud	632
<b>Maximum Allowable Clip Load</b>	<b>632</b>

## Load Direction

## Notes:

1. VertiClip SLF is designed to support horizontal loads, and should not be used in axial load-bearing walls.
2. Allowable loads have not been increased for wind, seismic, or other factors.
3. #12 screws are provided with each step bushing for attachment to the stud web.
4. Total vertical deflection of up to 1-1/2" (3/4" up and 3/4" down).
5. Align rows of wall bridging so that one row of bridging falls within 12" from VertiClip SLF OR use one flat strap brace on outer flange of studs to resist torsional effects.
6. Stud web crippling should be checked. Use 3-1/2" bearing length and use the "Interior One Flange Reaction, Condition 2, scenario for web crippling calculations. If justified, using the "End One Flange Reaction, Condition 1, scenario is acceptable.
7. For LRFD strengths contact TSN technical services.

## Nomenclature

VertiClip SLF is available in one size for all stud depths with 1 5/8" flanges and is designated *VertiClip® SLF162*

\* *VertiClip SLF for use with 2" stud flanges can be made as a custom part.*

## Example Details

VertiClip SLF used with TSN's BridgeBar® & BridgeClip® installed within 12" from the clip.

VertiClip SLF used with one flat strap brace on the outer flange of studs to resist torsional effects.

# VertiClip® SLT

Structure/Slab Bypass

## Material Composition

ASTM A1003/A1003M Structural Grade 50 (340) Type H, ST50H (ST340H): 50ksi (340MPa) minimum yield strength, 65ksi (450MPa) minimum tensile strength, 97mil minimum thickness (12 gauge, 0.1017" design thickness) with ASTM A653/A653M G90 (Z275) hot dipped galvanized coating.

The attachment of VertiClip SLT to the primary structure may be made with PAFs, screw/bolt anchors or weld and is dependent up the base material (steel or concrete) and the design configuration.

**\*\*Important notes for VertiClip SLT Allowable Load tables continued on next page.**

**Table Notes:**

1. VertiClip SLT is designed to support horizontal loads, and should not be used in axial load-bearing walls.
2. Allowable loads have not been increased for wind, seismic, or other factors.
3. #12 screws are provided with each step bushing for attachment to the stud web.
4. VertiClip SLT9.5 and SLT(S) allow up to 2" of vertical deflection (1" up and 1" down).
5. VertiClip SLT(L) allows up to 1-7/8" of vertical deflection (15/16" up and 15/16" down).
6. VertiClip SLT(S) Recommended Allowable Loads are based on (4) #12 screws at the stud attachment and either front or rear fastener attachment to the structure, respectively.
7. Torsional effects are considered on the screw group for F2 Allowable Loads. All torsion is attributed to the screws, none is attributed to the clip connection to the structure.
8. For attachment of VertiClip SLT to structure, it is recommended that fasteners to steel have a 1/2" minimum edge distance and that fasteners to concrete have a 2-1/4" minimum edge distance.
9. For LRFD strengths contact TSN technical services.

**Nomenclature**

VertiClip SLT9.5 is available in a length of 9 1/2". VertiClip SLT(S) is available in a length of 12". VertiClip SLT(L) is available in lengths of 12", 15", and 18". Determine length by adding stud + offset + 3" for steel (5.5" for concrete) and selecting the next largest size.

**Example:** 6" stud, 4" offset + 3"  
**Designate:** VertiClip® SLT(L)15

**Example Details**

VertiClip SLT9.5 attached to the underside of wide flange beam.

## Vertical Deflection Screw Patterns

## Rigid Connection Screw Patterns

**Pattern 1**  
2 Screws

**Pattern 2**  
3 Screws

**Pattern 3**  
2 Screws

**Pattern 4**  
3 Screws

**Pattern 5**  
4 Screws

**Notes:**

1. MasterClip VLB resists in plane of wall (F1), horizontal (F2), and vertical (F3) loads when used as a rigid connector.
2. MasterClip VLB resists in plane of wall (F1) and horizontal (F2) loads when used as a deflection connector.
3. Allowable loads have not been increased for wind, seismic, or other factors.
4. Design loads consider loads on the clip and #12 screw fasteners to the stud web.
5. Three #12 screws are provided with each connector (based on number of integrated breakaway step bushings). Load requirements don't always require the use of all screws provided.
6. Three slots are standard in 6" and higher web depths to accommodate construction tolerances. Use of a 3rd screw and bushing is dependent upon load requirements.
7. Total vertical deflection up to 2" (1" up and 1" down).
8. Guide holes in the 1-1/2" leg measure 0.141" in diameter.
9. Fasten within 3/4" of the angle heel (centerline of the 1-1/2" leg) to minimize eccentric load transfer.
10. Fasteners attaching clips to structure should be installed symmetrically around the center line of the clip. The allowable load of the clip may be reduced if fasteners are not installed symmetrically.
11. Allowable load tables incorporate eccentric loading of fasteners. Values with a welded connection may increase.
12. Torsional effects are considered on the screw group for F3 allowable loads. It is assumed that half of the torsional moment is taken by the connection to the structure and half is taken by the screw connection to the stud.
13. Loads listed reflect force in a single direction. When multiple loads react on the connection, it is the responsibility of the designer to check the interaction of forces.
14. For LRFD strengths contact TSN technical services.

**Nomenclature**

MasterClip VLB is designated by type (VLB), followed by stud depth in inches multiplied by 100.

**Example:** 6" stud.

**Designate:** MasterClip® VLB600

**Example Details**

The attachment of MasterClip to the primary structure may be made with PAFs, screw/bolt anchors or welds and is dependent upon the base material (steel, concrete or CMU) and the design configuration.

MasterClip® VLB used for Vertical Deflection

MasterClip® VLB used as a Rigid Connection

# DriftClip® DSLB

Bypass Slab

## Material Composition

ASTM A1003/A1003M Structural Grade 50 (340) Type H, ST50H (ST340H): 50ksi (340MPa) minimum yield strength, 65ksi (450MPa) minimum tensile strength, 97mil minimum thickness (12 gauge, 0.1017" design thickness) with ASTM A653/A653M G90 (Z275) hot dipped galvanized coating.

The attachment of DriftClip DSLB to the primary structure may be made with PAFs, screws, or bolt anchors depending on the base material (steel or concrete) and the design configuration. The step bushings used for attachment to structure are designed for use with 1/4" maximum diameter fasteners. Designing this connection is the responsibility of the Structural Engineer of Record, and a minimum of two fasteners must be used.

US Patent #6,612,087

<b>Max Allowable Clip Load</b>	<b>917</b>			<b>572</b>		

### Table Notes:

- Design loads are for attachment of DriftClip DSLB to stud only.
- Allowable loads have not been increased for wind, seismic, or other factors.
- DriftClip DSLB allows up to 2" of vertical deflection (1" up and 1" down), and 2" of lateral drift (1" left and 1" right) in plane. Deflection requirements greater than 2" of lateral drift are available.
- #12 screws are provided for each step bushing attachment to studs. Load requirements do not always require the use of a third screw.
- Attachment of structure to be engineered by others. As a design reference for the structure attachment, reference AISI S100 or screw manufacturers published data for allowable loads for screw fasteners of 1/4"-20 size with various plate thicknesses.
- One row of bridging is recommended at a maximum distance of 18" from DriftClip to resist torsional effects.
- For LRFD strengths contact TSN technical services.

### Nomenclature

DriftClip DSLB is classified by multiplying stud depth by 100.\*

**Example:** 6" stud depth

**Designate:** DriftClip® DSLB600

\* Parts with the designation "-CA" on the end of the part name includes a special bushing available to allow connection to the side of the concrete slab using two 1/4" concrete screw anchors.

\*\* If more than 2" lateral drift is required, contact TSN engineering.

## Allowable Screw Pullout

Section Thickness	Pullout 1/4" - 20 Screws*
0.0566"	261 lbs
0.0713"	328 lbs
0.1017"	468 lbs
1/8"	514 lbs
3/16"	770 lbs
1/4"	1,027 lbs
5/16"	1,284 lbs

- Limited by the allowable F2 loads shown in the table on the left
- 0.0566", 0.0713", and 0.1017" thick sections assumed to have ultimate tensile strength equal to 65 ksi.
- 1/8", 3/16", 1/4", and 5/16" thick sections assumed to have ultimate tensile strength equal to 58 ksi.
- Allowable screw pullout strengths calculated in accordance with AISI S100.

### Load Direction

**Fastener Patterns**

**Fastener Pattern 1** replicates a condition of out-of-plane wind or seismic force with no vertical live load deflection or in-plane drift.

**Fastener Pattern 2** replicates a condition of out-of-plane wind or seismic force with or without full vertical live load deflection and full in-plane drift.

# DriftClip® DSLS

Bypass Structure

### Material Composition

ASTM A1003/A1003M Structural Grade 50 (340) Type H, ST50H (ST340H): 50ksi (340MPa) minimum yield strength, 65ksi (450MPa) minimum tensile strength, 97mil minimum thickness (12 gauge, 0.1017" design thickness) with ASTM A653/A653M G90 (Z275) hot dipped galvanized coating.

The attachment of DriftClip DSLS to the primary structure may be made with PAFs, screws, or bolt anchors depending on the base material (steel or concrete) and the design configuration. The step bushings used for attachment to structure are designed for use with ¼" maximum diameter fasteners. Designing this connection is the responsibility of the Structural Engineer of Record, and a minimum of two fasteners must be used. A minimum of 3.5" of DSLS is required for attachment to steel structure and a minimum of 6" is required for attachment to concrete structure.

US Patent #6,612,087

# DriftClip® DSLD

Interior Head of Wall

### Material Composition

ASTM A1003/A1003M Structural Grade 50 (340) Type H, ST50H (ST340H): 50ksi (340MPa) minimum yield strength, 65ksi (450MPa) minimum tensile strength, 33mil minimum thickness (20 gauge, 0.0346" design thickness) with ASTM A653/A653M G60 (Z180) hot dipped galvanized coating.

The attachment of DriftClip DSLD to the primary structure utilizes step bushings designed for #8 (0.164") screws. Designing this connection is the responsibility of the Structural Engineer of Record, and a minimum of two fasteners must be used.

US Patent #6,612,087

<b>Max Allowable Clip Load</b>		<b>357</b>	<b>776</b>		<b>1,041</b>		<b>129</b>	<b>418</b>		<b>1,041</b>		

### Notes:

- Design loads are for attachment of DriftClip DSL to stud only.
- Allowable loads have not been increased for wind, seismic, or other factors.
- DriftClip DSL allows up to 2" of vertical deflection (1" up and 1" down), and 2" of lateral drift (1" left and 1" right) in plane. Deflection requirements greater than 2" of lateral drift are available.
- #12 screws are provided for each step bushing attachment to studs. Load requirements do not always require the use of a third screw.
- Attachment of structure to be engineered by others. As a design reference for the structure attachment, reference AISI S100 or screw manufacturers published data for allowable loads for screw fasteners of 1/4"-20 size with various plate thicknesses.
- One row of bridging is recommended at a maximum distance of 18" from DriftClip to resist torsional effects.
- For LRFD strengths contact TSN technical services.

### Load Direction

### Nomenclature

DriftClip DSL is classified by multiplying stud depth by 100.\*

**Example:** 6" stud depth

**Designate:** DriftClip® DSL600

\* Parts with the designation "-CA" on the end of the part name includes a special bushing available to allow connection to the side of the concrete slab using two ¼" concrete screw anchors

\*\* If more than 2" lateral drift is required, contact TSN engineering.

**Fastener Patterns**

**Fastener Pattern 1** replicates a condition of out-of-plane wind or seismic force with no vertical live load deflection or in-plane drift.

**Fastener Pattern 2** replicates a condition of out-of-plane wind or seismic force with full vertical live load deflection and full in-plane drift.

# DriftTrak® DT w/DTSL

Exterior Head of Wall

The Steel Network, Inc.   
www.steelnetwork.com  
1-888-474-4876

## Material Composition

**DTSL Clip Material:** ASTM A1003/A1003M Structural Grade 50 (340) Type H, ST50H (ST340H): 50ksi (340MPa) minimum yield strength, 65ksi (450MPa) minimum tensile strength, 68mil minimum thickness (14 gauge, 0.0713" design thickness) with ASTM A653/A653M G90 (Z275) hot dipped galvanized coating.

**Track Material:** ASTM A1003/A1003M Structural Grade 50 (340) Type H, ST50H (ST340H): 50ksi (340MPa) minimum yield strength, 65ksi (450MPa) minimum tensile strength, 97mil minimum thickness (12 gauge, 0.1017" design thickness) with ASTM A653/A653M G60 (Z180) hot dipped galvanized coating.

US Patent #7,503,150

## DriftTrak DT w/ DTSL Allowable (Unfactored) Loads

<b>Maximum Allowable Clip Load</b>		<b>625</b>	<b>482</b>	<b>625</b>	<b>449</b>

## Notes:

- Design loads are for attachment of DriftTrak DT w/ DTSL to stud only.
- Allowable loads have not been increased for wind, seismic, or other factors.
- Clips are manufactured to fit into DriftTrak DT. DriftTrak DT w/ DTSL allows up to 2" of vertical deflection (1" up and 1" down), and free lateral movement of the structure.
- #12 screws are provided for each step bushing attachment to studs.
- Attachment of structure to be engineered by others.
- One row of bridging is recommended at a maximum distance of 18" from DriftTrak DT w/ DTSL to resist torsional effects.
- DriftTrak DT w/ DTSL does not provide wall closure. A top track will be required for closure of the wall assembly.
- Allow a minimum of 7/8" from the structure to the top of the stud to allow for the attachment of the DriftTrak DT inside the standard track.
- For LRFD strengths contact TSN technical services.

## Nomenclature

DriftTrak® DT w/ DTSL is available in one size for all stud depths over 3 5/8".

**Example:** 6" stud depth

**Designate:** DriftTrak® DT w/ DTSL

DriftTrak DT is available in 10' and 12' lengths, and is designated: DriftTrak® DT-10' or DT-12'

\*\* A top track is required for closure of the wall assembly.

\*\*\* Clips and track sold separately.

## Load Direction

**Fastener Patterns**

**Fastener Pattern 1** replicates a condition of out-of-plane wind or seismic force with no vertical live load deflection and full in-plane drift.

**Fastener Pattern 2** replicates a condition of out-of-plane wind or seismic force with full vertical live load deflection and full in-plane drift.

97 (12)	50	808	808	753	753
<b>Maximum Allowable Clip Load</b>		<b>808</b>		<b>753</b>	

## Notes:

- Design loads are for attachment of DriftTrak DT w/ DTSLB to stud only.
- Allowable loads have not been increased for wind, seismic, or other factors.
- Clips are manufactured to fit into DriftTrak DT. DriftTrak DT w/ DTSLB allows up to 2" of vertical deflection (1" up and 1" down), and free lateral movement of the structure.
- #12 screws are provided for each step bushing attachment to studs. Load requirements don't always justify use of a third screw.
- Attachment to structure at 8" or 16" spacing to be engineered by others.
- One row of bridging is recommended at a maximum distance of 18" from DriftTrak DT w/ DTSLB to resist torsional effects.
- Notches are standard in DTSLB clips. For greater F2 load capacities, use DTSLB-HD clips without notches. Refer to allowable load tables.
- Allow a minimum of 7/8" from the structure to the inside flange of the bypassing stud to allow for track attachment.
- Total offset of stud from the edge of slab should not exceed 2" for DriftTrak DT w/ DTSLB362/400 or DTSLB600 clips.
- Total offset of stud from the edge of slab should not exceed 3-1/4" for DriftTrak DT w/ DTSLB800 clips.
- Total offset is measured from the edge of slab to the inside face of the stud.
- For LRFD strengths contact TSN technical services.

## Load Direction

**Nomenclature**

DriftTrak DT w/ DTSLB is specified by designating the track section and the clip size by multiplying the stud depth by 100.

**Example:** Track fastened at 8" or 16", 6" stud depth, with an outward load (F2) of 1,000 lbs

**Designate:** DriftTrak® DT w/ DTSLB600

**Fastener Patterns**

**Fastener Pattern 1** replicates a condition of out-of-plane wind or seismic force with no vertical live load deflection and full in-plane drift.

**Fastener Pattern 2** replicates a condition of out-of-plane wind or seismic force with full vertical live load deflection and full in-plane drift.

**Locking of Lateral Movement After Panel Installation**

To lock lateral movement after panel installation, fasten 1.5" x 2" x 0.5"- 68mil angle to DriftTrak components with #12 screws (not included). Locking is recommended at 4 ft. spacing or 3<sup>rd</sup> stud, max.

<b>Max Allowable Clip Load</b>	<b>1,009</b>		<b>1,197</b>			<b>1,163</b>		<b>1,750</b>			<b>1,272</b>			

## Notes:

- Design loads are for attachment of DriftTrak DT w/ DTLB to stud only.
- Allowable loads have not been increased for wind, seismic, or other factors.
- Clips are manufactured to fit into DriftTrak DT. DriftTrak DT w/ DTLB provides a rigid connection to the stud while allowing free lateral movement of the structure.
- Torsional effects are considered on screw group for F3 allowable loads. It is assumed that all of the torsional moment is taken by the connection to the stud.
- Loads listed reflect force in a single direction. When multiple loads act on the connection, it is the responsibility of the designer to check the interaction of forces.
- Attachment to structure at 8" spacing to be engineered by others.
- One row of bridging is recommended at a maximum distance of 18" from DriftTrak DT w/ DTLB if no other stud lateral restraint is present.
- Notches are standard in DTLB clips. For greater F2 load capacities, use DTLB-HD clips without notches. Refer to allowable load tables.
- Allow a minimum of 7/8" from the structure to the inside flange of the bypassing stud to allow for track attachment.
- Maximum total offset of stud from the edge of slab should not exceed 1" for DriftTrak DT w/ DTLB362/400 or DTLB600 clips.
- Maximum total offset of stud from the edge of slab should not exceed 1" for DriftTrak DT w/ DTLB800 clips with 8" studs and 3" for DriftTrak DT w/ DTLB800 clips with 6" studs.
- Maximum total offset is measured as track flange plus the gap from the open face of the track to the inside face of the stud.
- For LRFD strengths contact TSN technical services.

**Nomenclature**

DriftTrak DT w/ DTLB is specified by designating the track section and the clip size by multiplying the stud depth by 100.

**Example:** Track fastened at 8", 6" stud depth, with an outward load (F2) of 1,000 lbs and a gravity load (F3) of 400 lbs

**Designate:** DriftTrak® DT w/ DTLB600

**DTLB362 Fastener Patterns**

**DTLB600 and DTLB800 Fastener Patterns**

4 Hole Fastener Pattern

6 Hole Fastener Pattern

4 Hole Fastener Pattern

6 Hole Fastener Pattern

9 Hole Fastener Pattern

To lock lateral movement after panel installation, fasten 1.5" x 2" x 0.5"- 68mil angle to DriftTrak components with #12 screws (not included). Locking is recommended at 4 ft. spacing or 3<sup>rd</sup> stud, max.

## Notes:

- Design loads are for attachment of DriftTrak DT w/ DTLB-HD to stud only.
- Allowable loads have not been increased for wind, seismic, or other factors.
- Clips are manufactured to fit into DriftTrak DT. DriftTrak DT w/ DTLB-HD provides a rigid connection to the stud while allowing free lateral movement of the structure.
- Torsional effects are considered on screw group for F3 allowable loads. It is assumed that all of the torsional moment is taken by the connection to the stud.
- Loads listed reflect force in a single direction. When multiple loads act on the connection, it is the responsibility of the designer to check the interaction of forces.
- Attachment to structure at 8" spacing to be engineered by others.
- One row of bridging is recommended at a maximum distance of 18" from DriftTrak DT w/ DTLB-HD if no other stud lateral restraint is present.
- Allow a minimum of 7/8" from the structure to the inside flange of the bypassing stud to allow for track attachment.
- Maximum total offset of stud from the edge of slab should not exceed 1" for DriftTrak DT w/ DTLB362/400-HD or DTLB600-HD clips.
- Maximum total offset of stud from the edge of slab should not exceed 1" for DriftTrak DT w/ DTLB800-HD clips with 8" studs and 3" for DriftTrak DT w/ DTLB800-HD clips with 6" studs.
- Maximum total offset is measured as track flange plus the gap from the open face of the track to the inside face of the stud.
- For LRFD strengths contact TSN technical services.

**Nomenclature**

DriftTrak DT w/ DTLB600-HD is classified by multiplying stud depth by 100, followed by "HD," based on F2 strength required. Refer to load tables.

**Example:** Track fastened at 8", 6" stud depth, with an outward load (F2) of 1,000 lbs and a gravity load (F3) of 400 lbs

**Designate:** DriftTrak DT w/ DTLB600-HD

# DriftTrak® DTH w/ DTSLB-HD

Slab Integrated Bypass

### Description

DriftTrak® DTH (Headed Stud) w/ DTSLB-HD saves the time and expense of installing DriftTrak after the concrete slab has been poured, by integrating it directly into the slab before pouring. The headed studs come preinstalled to the DriftTrak DTH and function as the attachment to the post-tensioned slab instead of welding to the pour stop angle or use of PAF's or anchors. Once concrete is poured, the DriftTrak DTH is ready to support exterior steel framing using DTSLB-HD bypass clips to accommodate vertical deflection and lateral drift requirements.

US Patent #7,503,150 & Patent Pending

### Material Composition

**Track Material:** ASTM A1003/A1003M Structural Grade 50 (340) Type H, ST50H (ST340H): 50ksi (340MPa) minimum yield strength, 65ksi (450MPa) minimum tensile strength, 97mil minimum thickness (12 gauge, 0.1017" design thickness) with ASTM A653/A653M G60 (Z180) hot dipped galvanized coating.

**Headed Stud Material:** ASTM A29/A108, Grades 1010 through 1020 or equivalent, 45ksi (310MPa) minimum yield strength, 55ksi (380MPa) minimum tensile strength, 3/8" diam. x 3 1/8" length with 3/4" head diameter.

**Clip Material:** ASTM A1003/A1003M Structural Grade 50 (340) Type H, ST50H (ST340H): 50ksi (340MPa) minimum yield strength, 65ksi (450MPa) minimum tensile strength, 97mil minimum thickness (12 gauge, 0.1017" design thickness) with ASTM A653/A653M G90 (Z275) hot dipped galvanized coating.

<b>Max Allowable Clip Load</b>	<b>1,657</b>		

### Load Direction

### Notes:

- Design loads are for attachment of DriftTrak DTH w/ DTSLB-HD to stud and stud weld to track only.
- Allowable loads have not been increased for wind, seismic, or other factors.
- Clips are manufactured to fit into DriftTrak DTH. DriftTrak DTH w/ DTSLB-HD allows up to 2" of vertical deflection (1" up and 1" down), and free lateral movement of the structure.
- #12 screws are provided for each step bushing attachment to studs. Load requirements don't always justify use of a third screw.
- Maximum tension on a single anchor should not exceed 1,600 lbs ASD. In tension, the strength of the anchor itself should be considered. The weld does not need to be considered in tension as the load table and 1,600 lbs ASD maximum tension value are inclusive of the strength of the welds.
- Designers must check headed stud tension anchorage capacity into concrete per ACI 318 based on the actual headed stud edge distance an concrete compressive strength. For more information, call TSN Technical Support.
- One row of bridging is recommended at a maximum distance of 18" from DriftTrak DTH w/ DTSLB-HD to resist torsional effects.
- Standard offset of stud from the open face of the track should not exceed 1-1/4" for DriftTrak DTH w/ DTSLB362/400-HD or DTSLB600-HD clips.
- Standard offset of stud from the open face of the track should not exceed 2-1/2" for DriftTrak DTH w/ DTSLB800-HD clips.
- Offset is measured from the open face of the track to the inside face of the stud.
- For LRFD strengths contact TSN technical services.

**Nomenclature**

DriftTrak DTH is manufactured in 10' or 12' lengths, with headed studs in a single centered row (See DriftTrak® DTH: Dimensions, Layout, and Stud Spacing figure. To specify DriftTrak DTH for a vertical deflection specify DriftTrak DTH and the clip size by multiplying the stud depth by 100.

**Example:** Headed stud track, 6" stud depth, with an outward load (F2) of 1,000 lbs  
**Designate:** DriftTrak DTH w/ DTSLB600-HD

# DriftTrak® PTS w/ DTSLB-PTS

Slab Integrated Bypass - Post Tensioned Concrete Slabs

The Steel Network, Inc.   
 www.steelnetwork.com  
 1-888-474-4876

## Description

DriftTrak® PTS saves the time and expense of installing DriftTrak after the Post-Tensioned Concrete Slab (PTS) has been poured by integrating it directly into the slab before pouring. The headed studs come preinstalled to the DriftTrak PTS and function as the embedded anchorage to the post-tensioned slab instead of anchoring to a steel edge angle or post-installing concrete anchors. The DriftTrak PTS is sized to fit above or below the high-strength tendon reinforcing at edges of slabs. Once concrete is poured, the DriftTrak PTS is ready to support exterior steel framing using DTSLB-PTS bypass clips to accommodate vertical deflection and lateral drift requirements.

US Patent #7,503,150 & Patent Pending

## Material Composition

**Track Material:** ASTM A1003/A1003M Structural Grade 50 (340) Type H, ST50H (ST340H): 50ksi (340MPa) minimum yield strength, 65ksi (450MPa) minimum tensile strength, 97mil minimum thickness (12 gauge, 0.1017" design thickness) with ASTM A653/A653M G60 (Z180) hot dipped galvanized coating.

**Headed Stud Material:** ASTM A29/A108, Grades 1010 through 1020 or equivalent, 49ksi (340MPa) minimum yield strength, 61ksi (420MPa) minimum tensile strength, 3/8" diam. x 3 1/8" length with 3/4" head diameter.

**DTSLB-PTS Clip Material:** ASTM A1003/A1003M Structural Grade 50 (340) Type H, ST50H (ST340H): 50ksi (340MPa) minimum yield strength, 65ksi (450MPa) minimum tensile strength, 97mil minimum thickness (12 gauge, 0.1017" design thickness) with ASTM A653/A653M G90 (Z275) hot dipped galvanized coating.

## DriftTrak PTS & DTSLB-PTS Connector Nomenclature

DriftTrak® PTS is manufactured in 10' or 12' lengths, with headed studs welded in a single row (see drawing below). DTSLB-PTS clip connectors are inserted and rotated into place inside the DriftTrak PTS to better facilitate panel installation while accommodating vertical deflection and lateral drift requirements in floor slab bypass conditions. Connectors are sold separately, and paired with DriftTrak PTS to support 6" and 8" stud framing. The connectors are classified by multiplying the stud depth by 100, followed by "PTS", then "-L" for a Left version or "-R" for a Right version.

**Example:** Vertical Deflection required, left version required for installation with 6" stud  
**Designate:** DriftTrak® PTS w/ DTSLB600-PTS-L

\* Clip shown is left version of DTSLB-PTS.  
 Right side version is available for order as standard parts.  
 \*\* Clips and track sold separately.

Load Direction

Fastener Patterns

**Notes:**

- Design loads are for attachment of DriftTrak PTS w/ DTLB-PTS to stud and stud weld to track only.
- Allowable loads have not been increased for wind, seismic, or other factors.
- Clips are manufactured to fit into DriftTrak PTS. DriftTrak PTS w/ DTLB-PTS provides a rigid connection to the stud while allowing free lateral movement of the structure.
- Torsional effects are considered on screw group for F3 allowable loads. It is assumed that all of the torsional moment is taken by the connection to the stud.
- Loads listed reflect force in a single direction. When multiple loads act on the connection, it is the responsibility of the designer to check the interaction of forces.
- Maximum tension on a single anchor should not exceed 1,600 lbs ASD. In tension, the strength of the anchor itself should be considered. The weld does not need to be considered in tension as the load table and 1,600 lbs ASD maximum tension value are inclusive of the strength of the welds.
- Designers must check headed stud tension anchorage capacity into concrete per ACI 318 based on the actual headed stud edge distance an concrete compressive strength. For more information, call TSN Technical Support.
- One row of bridging is recommended at a maximum distance of 18" from DriftTrak PTS w/ DTLB-PTS if no other stud lateral restraint is present.
- Standard offset of stud from the open face of the track should not exceed 1-7/8" for DriftTrak PTS w/ DTLB600-PTS clips.
- Standard offset of stud from the open face of the track should not exceed 2-1/2" for DriftTrak PTS w/ DTLB800-PTS clips.
- Offset is measured from the open face of the track to the inside face of the stud.
- For LRFD strengths contact TSN technical services.

# Wall Bridging

## Background

### Bridging Background

Bridging for load bearing and curtain wall studs is needed to resist the following forces:

- 1 - Weak axis buckling induced by axial compression load.
- 2 - Torsion induced by wind load.

As axial compression and lateral wind loads are applied, wall studs react with weak axis buckling and torsional rotation. To offset these forces, a form of bridging is incorporated into the wall system. Bridging loads accumulate over the run of the wall, requiring transfer of lateral forces in bridging at columns or to the floor slab into the structural load path to the foundation.

AISI S100 (Specification) and AISI S240 (Standard For Structural Framing) provide the load and stiffness requirements for bracing members due to the effects of axial compression load and wind load as given in the table below. Contact TSN Technical Support if further information is needed regarding wall bridging design.

### Bridging Requirements

	AISI S240 (Standard For Structural Framing)	AISI Specification (S100)
<b>Stud Axial Compression</b>	<p><b>Load Capacity:</b>                      Bracing Load <math>P_{\text{Brace}}^* = 0.02 \times \text{Stud Compression Load } (P_{\text{Stud}}) \times \# \text{ of studs braced.}</math></p>	<p><b>Load Capacity:</b>                      Bracing Load <math>P_{\text{Brace}}^* = 0.01 \times \text{Stud Allowable Compression } (P_{a\_stud}) \times \# \text{ of studs braced.}</math></p> <p><b>Stiffness Capacity:</b>                      Lateral Stiffness <math>\beta_{\text{Brace}} = 4 \times \text{Stud Nominal Axial Strength} / \text{Unbraced Length}</math> (for one row of bridging).                      Lateral Stiffness <math>\beta_{\text{Brace}} = 6 \times \text{Stud Nominal Axial Strength} / \text{Unbraced Length}</math> (for two rows of bridging).</p>
<b>Wind</b>	<p><b>Load Capacity:</b>                      Twist Load <math>P_L = 1.5 \times \text{Wind Load} \times \text{Bridging Spacing} \times \text{Stud Spacing} \times m(\text{Shear Center Distance}) / \text{Stud Depth.}</math>                      Twist Moment <math>M_1 = P_L \times \text{Stud Depth.}</math></p>	

\* Bracing forces accumulate over the run of the wall until anchored.

**\*\*Important table notes on next page.**

**Notes:**

1. Listed wind pressures represent calculated design wind pressure (0.6W based on 2021 IBC).
2. Allowable pressures are limited by published test data allowable torsional moments for bridging elements.
3. Torsional moment acting on bridging elements is calculated as:  
 **$M = 1.5 \times \text{Wind Pressure} \times \text{Bridging Spacing} \times \text{Stud Spacing} \times m$  (distance from stud web to shear center).**
4. Wall height is assumed twice the bridging spacing.
5. BuckleBridge® stud spacing is fixed at 16".
6. 20 psf and higher wind pressures have been multiplied by 0.7 for deflection determination, in accordance with footnote "f" of IBC table 1604.3. The 10 psf pressure has not been reduced for deflection checks.
7. Stud design is limited by its flexural strength calculated with torsional bracing assumed at the bridging spacing and  $k\phi = 0$  and deflection limit of  $L/360$ .
8. 'N/A' indicates stud and/or bridging cannot be designed. Reduced stud spacing or bridging spacing is required.

**Nomenclature:**

- BC-33, 1** - BridgeClip® BC-33 with (1) #10 screw fastener into bridging member.  
**BC-33, 3** - BridgeClip® BC-33 with (1) #10 screw fastener into bridging member and (2) #10 screw fasteners into the web of the stud.  
**BC-43, 1** - BridgeClip® BC-43 with (1) #10 screw fastener into bridging member.  
**BC-43, 3** - BridgeClip® BC-43 with (1) #10 screw fastener into bridging member and (2) #10 screw fasteners into the web of the stud.  
**BC600** - BridgeClip® BC600 with (2) #10 screw fasteners into bridging member and (2) #10 screw fasteners into the web of the stud.  
**BC800** - BridgeClip® BC800 with (2) #10 screw fasteners into bridging member and (2) #10 screw fasteners into the web of the stud.  
**BKB** - BuckleBridge® with (1) #10 screw on alternate sides of the BuckleBridge at 3rd stud (48" o.c.). Use (2) #10 screws at end of wall run.

# Wall Bridging Anchorage

Quick Reference

## Anchorage of Lateral Bracing (Bridging) Forces

**Load Bearing Wall Bridging Row Anchored to Jamb Stud or End Column - Track Bracing Utilizing BridgeBar® 150 with BC600/BC800**

**Load Bearing Wall Bridging Row Anchored to Jamb Stud or End Column - Track Bracing Utilizing BuckleBridge®**

**Load Bearing Wall Bridging Row Anchored to Floor System Through Cross Bracing - Utilizing BuckleBridge**

**Load Bearing Wall Bridging Row Anchored to Floor System Through Cross Bracing - Utilizing BridgeBar 150 with BC600/BC800**

**Load Bearing Wall Bridging Row Anchored to Jamb Stud or End Column - Flat Strap Bracing w/ Blocking**

**Load Bearing Wall Bridging Row Anchored to Jamb Stud or End Column - Flat Strap Bracing w/ Blocking**

# BridgeClip®

Secures Channel to Stud

### Material Composition

**BC-33:** ASTM A1003/A1003M Structural Grade 50 (340) Type H, ST50H (ST340H): 50ksi (340MPa) minimum yield strength, 65ksi (450MPa) minimum tensile strength, 33mil minimum thickness (20 gauge, 0.0346" design thickness) with ASTM A653/A653M G90 (Z275) hot dipped galvanized coating.

**BC-43, BC600 & BC800:** ASTM A1003/A1003M Structural Grade 50 (340) Type H, ST50H (ST340H): 50ksi (340MPa) minimum yield strength, 65ksi (450MPa) minimum tensile strength, 43mil minimum thickness (18 gauge, 0.0451" design thickness) with ASTM A653/A653M G90 (Z275) hot dipped galvanized coating.

Load Direction

US Patent #5,904,023

### Table Notes:

- Listed ASD allowable loads are based on ultimate test data divided by a factor of safety.
- Listed ASD allowable loads are limited by screw shear or pullout at stud web.

Table Nomenclature	Clip	Qty # 10 Screws into Bridging	Qty # 10 Screws into Stud
BC-33, 1	BC-33	1	0
BC-33, 3	BC-33	1	2
BC-43, 1	BC-43	1	0
BC-43, 3	BC-43	1	2
BC600	BC600	2	2
BC800	BC800	2	2

### Nomenclature

BridgeClip is designated by the type BC.

# BridgeBar®

Bridging Channel

### Material Composition

**BB75:** ASTM A1003/A1003M Structural Grade 33 (230) Type H, ST33H (ST230H): 33ksi (230MPa) minimum yield strength, 45ksi (310MPa) minimum tensile strength, 28mil minimum thickness (22 gauge, 0.0295" design thickness) with ASTM A653/A653M G60 (Z180) hot dipped galvanized coating.

**BB150:** ASTM A1003/A1003M Structural Grade 50 (340) Type H, ST50H (ST340H): 50ksi (340MPa) minimum yield strength, 65ksi (450MPa) minimum tensile strength, 33mil minimum thickness (20 gauge, 0.0346" design thickness) with ASTM A653/A653M G90 (Z275) hot dipped galvanized coating.

US Patent #6,701,689

### Material Analysis

Section	Minimum Thickness (in)	Design Thickness (in)	Yield Strength (ksi)	Effective Section Properties <sup>(1)</sup>						Effective Section Properties and Allowable Loads <sup>(2), (3), (4)</sup>							
				Area (in <sup>2</sup> )	I <sub>x</sub> (in <sup>4</sup> )	S <sub>x</sub> (in <sup>3</sup> )	R <sub>x</sub> (in)	I <sub>y</sub> (in <sup>4</sup> )	R <sub>y</sub> (in)	S <sub>xe</sub> (in <sup>3</sup> )	M <sub>a</sub> (X-axis) in-kips (ft-lb)	12" o.c.		16" o.c.		24" o.c.	
												A <sub>e</sub> (in <sup>2</sup> )	P <sub>a</sub> (lbs)	A <sub>e</sub> (in <sup>2</sup> )	P <sub>a</sub> (lbs)	A <sub>e</sub> (in <sup>2</sup> )	P <sub>a</sub> (lbs)
BB75	0.0280	0.0295	33	0.031	0.0021	0.006	0.261	0.0002	0.073	0.006	0.11 (9.3)	N/A	N/A	N/A	N/A	N/A	N/A

### Notes:

- Use BridgeClip® for a quick & easy method of securing BridgeBar to stud when required
- Resists compressive loads through the plane of the wall
- Use through 3/4" and 1 1/2" stud punchouts.

<sup>1</sup> Gross section properties are calculated based on the minimum dimensions of the cross section.

<sup>2</sup> Effective section properties and allowable loads for BridgeBar are calculated based on AISI S100-2016 Specification.

<sup>3</sup> Effective section modulus (S<sub>xe</sub>) is calculated based on the minimum dimensions of the cross section.

<sup>4</sup> Effective area (A<sub>e</sub>) and allowable axial load (P<sub>a</sub>) are calculated based on the average dimensions of the cross section.

### Securing Bar to Stud

When loads require attachment of BridgeBar to stud, consider the screw shear allowables below for connection of BridgeClip to stud and BridgeBar.

Section	Design Thickness (in)	Yield Strength (ksi)	Allowable Shear/Screw	
			#8 Screw (lbs)	#10 Screw (lbs)
BB150	0.0346	50	237	255

### Nomenclature

BridgeBar is available in 3/4" and 1 1/2" widths. Designations are BB75 and BB150.

**Example:** Stud with 3/4" knockout  
**Designate:** BB75

### Cross Sections

### Load Direction

### Lap Joint

BridgeBar's 52" length allows for a 4" overlap at joints. Simply fit one end over the other and line up the guide holes for quick & easy placement of screw(s). Joint locations maintain stud spacing as designed through length of the wall system.

# BuckleBridge®

Bridging System

### Material Composition

ASTM A1003/A1003M Structural Grade 50 (340) Type H, ST50H (ST340H): 50ksi (340MPa) minimum yield strength, 65ksi (450MPa) minimum tensile strength, 33mil minimum thickness (20 gauge, 0.0346" design thickness) with ASTM A653/A653M G90 (Z275) hot dipped galvanized coating.

US Patents #7,596,921, #7,836,657 & #8,205,402

### BuckleBridge Allowable Loads

BuckleBridge® Allowable Loads						
Studs 16" o.c.	Axially Loaded Studs				Laterally Loaded Studs	
	Compression Brace		Tension Brace		6" Studs	8" Studs
	F1 (lbs)	Stiffness (lbs/in)	F1 (lbs)	Stiffness (lbs/in)	M1 (in-lb)	M1 (in-lb)
	2,400	31,000	440	2,560	1,290	967

### Load Direction

### Nomenclature

BuckleBridge comes in one size and is designated *BuckleBridge*®. It is used with 16" o.c. member spacing.

### Example Details

When using BuckleBridge in curtain walls with standard "cee" studs, one screw is only needed every 3rd stud.\*

BuckleBridge used in load bearing walls with TSN's SigmaStud

BuckleBridge works just as easily with back-to-back studs.

### Notes:

- Resists weak axis buckling and torsional rotation of members.
  - Spaces studs automatically at 16" o.c. Suitable for 6" & 8" walls.
  - Elongated tabs in one end of BuckleBridge lock into a slot at the other end through the stud knockout.
- \* Use (1) #10 screw on alternate sides of the BuckleBridge at 3rd stud (48" o.c.) Use (2) #10 screws at end of wall run.

# StiffClip® LB

Spandrel Wall Bypass

### Material Composition

ASTM A1003/A1003M Structural Grade 50 (340) Type H, ST50H (ST340H): 50ksi (340MPa) minimum yield strength, 65ksi (450MPa) minimum tensile strength, 68mil minimum thickness (14 gauge, 0.0713" design thickness) with ASTM A653/A653M G90 (Z275) hot dipped galvanized coating.

The attachment of StiffClip LB to the primary structure may be made with PAFs, screw/bolt anchors or weld and is dependent upon the base material (steel or concrete) and the design configuration.

### Nomenclature

StiffClip LB is available for various stud depths. To specify, multiply stud depth by 100.

**Example:** 6" stud depth  
**Designate:** StiffClip® LB600

<b>Maximum Allowable Clip Load</b>	<b>1,561</b>			<b>1,923</b>			<b>1,192</b>			<b>1,902</b>		

**Load Table Notes:**

1. Design loads are for attachment of StiffClip LB to stud only. Load tables reflect in plane of wall loads (F1), horizontal loads (F2) and vertical loads (F3).
2. Design loads consider loads on the clip and #12 screw fasteners to the stud web.
3. Loads listed reflect force in a single direction. When multiple loads react on the connection, it is the responsibility of the designer to check the interaction of forces.
4. Torsional effects are considered on screw group for F3 allowable loads. It is assumed that half of the torsional moment is taken by the connection to the structure and half is taken by the connection to the stud.
5. Attachment to structure engineered by others.
6. Allowable loads have not been increased for wind, seismic, or other factors.
7. Allowable load tables incorporate eccentric loading of fasteners. Values with a welded connection may increase.
8. Fasten within 3/4" from the angle heel (centerline of the 1-1/2" leg) to minimize eccentric load transfer.
9. Strengthening ribs are present in 3-5/8", 6", and 8" clip sizes. 10" and 12" clip sizes contain 1/2" return lips on the top and bottom of the leg attaching to the stud for increased stiffness.
10. For LRFD strengths contact TSN technical services.

### Load Table Notes:

- Design loads are for attachment of StiffClip LB-HD to stud only. Load tables reflect in plane of wall loads (F1), horizontal loads (F2) and vertical loads (F3).
- Design loads consider loads on the clip and #12 screw fasteners to the stud web.
- Loads listed reflect force in a single direction. When multiple loads react on the connection, it is the responsibility of the designer to check the interaction of forces.
- Torsional effects are considered on screw group for F3 allowable loads. It is assumed that half of the torsional moment is taken by the connection to the structure and half is taken by the connection to the stud.
- Attachment to structure engineered by others.
- Allowable loads have not been increased for wind, seismic, or other factors.
- Guideholes for stud connection are 0.172" diameter for #12 screws. Guideholes for structure connection are 3/8" diameter for (2) 1/4" diameter anchors.
- Fasten within 3/4" from the angle heel (centerline of the 1-1/2" leg) to minimize eccentric load transfer.
- For LRFD strengths contact TSN technical services.

# VertiClip® Splice

## Multi-Stud Bypass

### Material Composition

ASTM A1003/A1003M Structural Grade 50 (340) Type H, ST50H (ST340H): 50ksi (340MPa) minimum yield strength, 65ksi (450MPa) minimum tensile strength, 68mil minimum thickness (14 gauge, 0.0713" design thickness) with ASTM A653/A653M G90 (Z275) hot dipped galvanized coating.

The attachment of VertiClip to the primary structure may be made with PAFs, screw/bolt anchors or weld and is dependent upon the base material (steel or concrete) and the design configuration.

### Load Direction

\*Clip shown is a left version of VertiClip Splice. Right side versions can be made as a custom part.

### Screw Patterns

### Load Table Notes:

- Design loads are for attachment of VertiClip Splice to stud only. Load tables reflect horizontal loads (F2) and vertical loads (F3).
- Design loads consider loads on the clip and #12 screw fasteners to the stud web.
- Loads listed reflect force in a single direction. When multiple loads react on the connection, it is the responsibility of the designer to check the interaction of forces.
- Torsional effects are considered on screw group for F3 allowable loads. It is assumed that half of the torsional moment is taken by the connection to the structure and half is taken by the connection to the stud.
- Attachment to structure engineered by others.
- Allowable loads have not been increased for wind, seismic, or other factors.
- Total vertical deflection of up to 2" (1" up and 1" down). Deflection requirements greater than 1" up and down are available.
- Fasten within 3/4" from the angle heel (centerline of the 1-1/2" leg) to minimize eccentric load transfer.
- For LRFD strengths contact TSN technical services.

### Nomenclature

VertiClip Splice is designated by multiplying stud depth by 100.

# StiffClip® CL

Floor Tie

### Material Composition

**68mil Clip:** ASTM A1003/A1003M Structural Grade 50 (340) Type H, ST50H (ST340H): 50ksi (340MPa) minimum yield strength, 65ksi (450MPa) minimum tensile strength, 68mil minimum thickness (14 gauge, 0.0713" design thickness) with ASTM A653/A653M G90 (Z275) hot dipped galvanized coating.

**118mil Clip:** ASTM A1003/A1003M Structural Grade 50 (340) Type H, ST50H (ST340H): 50ksi (340MPa) minimum yield strength, 65ksi (450MPa) minimum tensile strength, 118mil minimum thickness (10 gauge, 0.1242" design thickness) with ASTM A653/A653M G90 (Z275) hot dipped galvanized coating.

**"H" Plate:** ½" steel, ASTM A36, 36ksi min yield, 58-80ksi min tensile, with ASTM B633 Type II Yellow Zinc Coating, or Paint, or Equivalent.

The attachment of StiffClip to the primary structure may be made with PAFs, screw/bolt anchors or weld and is dependent upon the base material (steel or concrete) and the design configuration.

CL (H) Plate

US Patent #7,533,508

Load Direction

Load Table Notes:

- Design loads are for attachment of StiffClip CL to stud only. Load tables reflect in plane of wall loads (F1), horizontal loads (F2), vertical loads (F3), and overturning loads (M1).
- M1 loads are reported as Max. Load divided by a Factor of Safety. M1 loads may be limited by the Serviceability Load calculated as Clip Stiffness times the Serviceability Limit in radian.
- Stiffness is the Allowable Clip Moment divided by the clip rotation measured at half of the Max Allowable Clip Moment.
- Design loads consider loads on the clip and #12 screw fasteners to the stud web.
- Loads listed reflect force in a single direction. When multiple loads react on the connection, it is the responsibility of the designer to check the interaction of forces.
- Torsional effects are considered on screw group for F2 allowable loads. It is assumed that half of the torsional moment is taken by the connection to the structure and half is taken by the connection to the stud.
- Attachment to structure engineered by others.
- Allowable loads have not been increased for wind, seismic, or other factors.
- Allowable load tables incorporate eccentric loading of fasteners. Values with a welded connection may increase.
- Guide holes are in place for fastener installation efficiency. All guide holes may not require fasteners. Fastener amount determined by the designer. Screw fastener should be symmetrically placed in guide holes. Refer to screw pattern diagrams below for placement.
- Fasten within 3/4" from the angle heel (centerline of the 1-1/2" leg) to minimize eccentric load transfer.
- Center guide hole is 9/16" in diameter for 1/2" anchors. Middle guide holes are 5/16" in diameter for 3/8" anchors. Outer guide holes and guide holes in 3" leg are 0.141" in diameter.
- For LRFD strengths contact TSN technical services.

Screw Patterns

Nomenclature

To specify StiffClip CL on drawings, multiply stud depth by 100, followed by the appropriate material thickness, based on strength required (see load tables). The StiffClip CL118(H) utilizes a plate in the 1 1/2" leg (shown on page 1).

**Example:** 6" stud, uplift load of 650lbs  
**Designate:** StiffClip® CL600-68

**Anchor Bolt Design**

The following equation for tension force in the anchor is derived using the assumed bearing stress distribution shown in the figure to the right. This assumed stress distribution provides a conservative anchor force approximation.

$$T = \frac{M}{\left(\frac{2}{3}\right)\left(d_{clip}/2\right)} = \frac{3M}{d_{clip}}$$

# MidWall™

Partial Wall Framing

The Steel Network, Inc.   
 www.steelnetwork.com  
 1-888-474-4876

### Material Composition

**MidWall:** ASTM A1003/A1003M Structural Grade 50 (340) Type H, ST50H (ST340H), 50ksi (340MPa) minimum yield strength, 65ksi (450MPa) minimum tensile strength, G90 (Z275) hot-dipped galvanized coating. Material Thickness = 118mil (10 gauge, 0.1242" design thickness) for 250MW and 362MW. Material Thickness = 97mil (12 gauge, 0.1017" design thickness) for 600 MW.

**MidWall Plate:** ASTM A36/A36M: 36ksi (250MPa) minimum yield strength, 58-80ksi (400-550MPa) tensile strength, 1/2" minimum thickness.

US Patent #8,387,321

### MidWall Allowable Loads

Wall Width (in)	MidWall™ Member	Maximum Point Load @ 48" (ASD), lbs	Maximum Base Moment, lbs-in
2 1/2	250MW	128	6,150
3 5/8"	362MW	332	15,940
6	600MW	407	19,540

### Notes

- MidWall is designed to support out-of-plane loading in cantilevered partial wall systems that are unsupported at the top track.
- Out-of-plane loads are transferred to the floor system through plate nested in the flanges of the member with two 3/8" diameter fasteners (or one 1/2" diameter fastener for 250MW) used for the connection.
- MidWall may be used in place of standard framing members, or in conjunction with them to frame the wall.

### Nomenclature

MidWall is currently available in two heights and three depths. Product nomenclature lists the member depth first followed by the height in inches

**Example:** 6" web depth, 24" tall MidWall

**Designate:** 600MW-24

### Example Details

MidWall 24" is generally used in interior half walls of less than 48" in height. Attach MidWall 24" to a 54mil stud with #12 screws through all pre-drilled guide holes. Other studs in the walls are typical infill studs. Maximum spacing between MidWall connectors is 36" o.c. (see table on following page). Contact TSN Technical Services at (888) 474-4876 for design recommendations.

MidWall 48" is used in interior half walls equal to or more than 48" in height. Use one MidWall 48" as a substitute for a stud at the specified spacing, or attach to a 54mil stud with #12 screws through all pre-drilled guide holes. Maximum spacing between MidWall connectors is 36" o.c.

**Design Information**

**Criteria:**

IBC 2021

Refer to Section 1607.9.1

**Applications:**

- Handrails and Guards
- Interior Half Walls
- Parapets
- Ribbon Windows

**Handrails and Guards:**

- 50 lb/ft applied in any direction at the top of wall
- 200 lbs applied in any direction at any point at the top of the wall

**Parapets & Ribbon Windows:**

- Design Wind Pressure

**Interior Half Walls:**

- Design internal pressure

**Design Procedure**

The top track spanning between MidWall members acts as a load distribution member capable of distributing localized loads to multiple MidWall members. It is recommended to design the track in these applications. Refer to the diagram above for an example of the distribution of the point load, P, to adjacent MidWall supports. At the end of the wall, MidWall is required at adjacent stud spacings. Designed spacing begins after two adjacent end supports.

# StiffClip® TD

Uplift Connector

The Steel Network, Inc.   
 www.steelnetwork.com  
 1-888-474-4876

### Material Composition

**TD-LT:** ASTM A1003/A1003M Structural Grade 50 (340) Type H, ST50H (ST340H): 50ksi (340MPa) minimum yield strength, 65ksi (450MPa) minimum tensile strength, 118mil minimum thickness (10 gauge, 0.1242" design thickness) with ASTM A653/A653M G90 (Z275) hot dipped galvanized coating.

**TD:** ASTM A1003/A1003M Structural Grade 55 (380) Type H, ST55H (ST380H): 55ksi (380MPa) minimum yield strength, 70ksi (480MPa) minimum tensile strength, 118mil minimum thickness (10 gauge, 0.1242" design thickness) with ASTM A653/A653M G90 (Z275) hot dipped galvanized coating.

**TD Plate:** ASTM A36/A36M: 36ksi (250MPa) minimum yield strength, 58-80ksi (400-550MPa) minimum tensile strength, with ASTM B633 Type II Yellow Zinc Coating, Paint, Powder Coating, or E-Coating, or approved equivalent.

**Table Notes:**

1. Design loads are for attachment of StiffClip TD to stud only. Load tables reflect vertical loads (F3).
2. Design loads consider loads on the clip and listed fasteners to the stud web for wood framing.
3. Attachment to structure engineered by others.
4. Allowable shear for nails and screws is increased 60% for wind and seismic loads in wood framing.
5. Fasten within 1-1/4" from the heel angle using the existing anchor hole.
6. Guide holes are in place for fastener installation efficiency. The number of fasteners are determined by the designer.
7. Attachment to stud is made with up to 27 #12 screws, symmetrically place.
8. For wood with moisture content > 19%, consult The Steel Network, Inc. for reduction in values.
9. For LRFD strengths contact TSN technical services.

**Nomenclature**

StiffClip TD-LT is available in one size without the use of the 'TD Plate'. Contact TSN about installation with alternate anchor sizes. StiffClip TD is available in one size and can be used with or without a 3/4" plate on top of the 2 3/8" leg. Anchor hole accommodates 7/8" diameter anchor.

Example: 6" stud, 5/8" dia. anchor to concrete, holddown without plate

Designate: StiffClip® TD-LT

Example: 8" stud, 7/8" dia. anchor to concrete, holddown with plate

Designate: StiffClip® TD w/ Plate

<b>Max Allowable Clip Load</b>	<b>5,545</b>						<b>2,968</b>		

### Load Table Notes:

1. Torsional effects are considered on screw group for F2 & F3 allowable loads. It is assumed that half of the torsional moment is taken by the connection on one side and half is taken by the connection on the other side of the clip.
2. Attachment to stud is made with screws symmetrically placed. All guide holes may not require fasteners. Fastener amount determined by designer.
3. Allowable loads have not been increased for wind, seismic, or other factors.
4. The minimum combination of steel thickness and yield strength must be used when determining the maximum design load.
5. Design loads listed consider both loads on the clip and the #10 screws fastened to the jamb and header members.
6. Refer to screw patterns on the following page.
7. For LRFD strengths contact TSN technical services.

### Load Direction

**Screw Patterns for HE(L) & HE(H) F3 Load Tables**

**Screw Patterns for HE(S) F3 Load Tables**

**Screw Patterns for F2 Load Tables**

**Allowable Loads: Welded Connection**

StiffClip® HE(H): F3 Load Direction - Welded	
HE(H)	
54mil (16ga), 50ksi Stud (And Thicker)	4,177

**Notes:**

1. The standard StiffClip HE(H) clip does not include all four large holes in the web of the clip. Special orders for these clips can be made by request.
2. Allowable F3 welded values do not apply for the 43mil (18ga) StiffClip (HE(L)).
3. StiffClip HE(H) allowable F3 welded values are applicable to clips with welds around the perimeter of the single 1/2" diameter hole, three 3/8" diameter holes, and along each side of the clip. Weld size is not to exceed double the material thickness of the header or jamb, or 1/8". Care should be taken to not burn through the material.

**Nomenclature**

StiffClip HE is available in two thicknesses. The StiffClip HE(L) is 43mil (18ga), and the StiffClip HE(H) & HE(S) are both 68mil (14ga).

\* Clips are packaged as pairs. Four StiffClip HE clips are used at each opening: two left-hand and two right-hand clips attach the complete header to the jamb.

**Weld Diagram**

1/8" weld around three 3/8" diameter holes, one 1/2" diameter hole, with 1/8" welds along each side.

### Load Direction

### Notes:

- Design loads are for attachment of StiffClip HS to the jamb. Use minimum (4) #12 screws for the attachment of the clip to the header or sill. Load tables reflect horizontal loads (F2) and vertical loads (F3).
- Design loads consider loads on the clip and #12 screw fasteners to the jamb web.
- Loads listed reflect force in a single direction. When multiple loads react on the connection, it is the responsibility of the designer to check the interaction of forces.
- Up to 1/4" gap is allowed between the jamb and the end of the header/sill member.
- Allowable loads apply to 250, 300, and 350 flange sizes.
- Allowable loads have not been increased for wind, seismic, or other factors.
- For LRFD strengths contact TSN technical services.

### Nomenclature

StiffClip HS is available for attachment to 3  $\frac{5}{8}$ ", 6", or 8" jambs, and for use with JamStuds with 2  $\frac{1}{2}$ ", 3" or 3  $\frac{1}{2}$ " flanges. To specify, multiply jamb width and header flange width by 100.

**Example:** 6" jamb and a header flange width of 2  $\frac{1}{2}$ "

**Designate:** StiffClip® HS600-250

<b>Max Allowable Clip Load</b>	<b>4,560</b>		<b>4,560</b>		<b>4,560</b>	

### Notes:

1. Design loads are for attachment of StiffClip HC to cold formed framing only. Load tables reflect vertical loads (F3).
2. Design loads consider loads on the clip and #12 screw fasteners in each leg.
3. Torsional effects are considered on screw group for F3 allowable loads. It is assumed that half of the torsional moment is taken by screw group in each leg of clip.
4. Allowable loads have not been increased for wind, seismic, or other factors.
5. For LRFD strengths contact TSN technical services.

### Nomenclature

StiffClip HC is designated by multiplying rafter depth by 100, then listing material thickness.

**Example:** 6" rafter depth, 68mil steel thickness

**Designate:** StiffClip® HC600-68

\*\*Standard angle bend is 135°. Other bend angles are available.

### Load Direction

# StiffClip® RT

<b>Maximum Allowable Clip Load</b>	<b>358</b>		<b>386</b>		<b>809</b>	

**Notes:**

1. Design loads are for attachment of StiffClip RT to light gauge framing members only. Load tables reflect in plane of wall loads (F1), horizontal loads (F2) and vertical uplift loads (F3).
2. Number of screws designated represent the amount of #12 screws required in each leg of clips.
3. Loads listed reflect force in a single direction. When multiple loads react on the connection, it is the responsibility of the designer to check the interaction of forces.
4. Torsional effects are considered on screw groups for F1, F2, and F3 allowable loads. It is assumed that half of the torsional moment is taken by the connection to the structure and half is taken by the connection to the stud.
5. Allowable loads have not been increased for wind, seismic, or other factors.
6. StiffClip RT650 is available in a Left version and Right version. Contact TSN for ordering assistance.
7. For LRFD strengths contact TSN technical services.

**Nomenclature**

StiffClip RT650 is 6½” long, and may be used when wall studs do not align with roof framing member. The RT1300 is 13” long, and is used when wall studs align with roof framing member. Clips are designated by length, followed by thickness and number of screws used in each leg (determined by load requirements - refer to load tables).

**Example:** Stud aligns with roof framing member (see application image)

**Designate:** StiffClip® 1300

\* StiffClip RT650 are packaged in pairs.

<b>Max Allowable Clip Load</b>	<b>7,756**</b>				<b>1,005**</b>					<b>10,576**</b>				

**Table Notes:**

1. Design loads are for attachment of StiffClip WC to light gauge framing members only. Allowable load tables apply to tension and compression on StiffClip WC utilizing the fastener patterns shown on the next page.
2. All guide holes may not require fasteners. Number and size of fasteners used is based on fastener manufacturer's allowable load data, and is to be verified by the designer.
3. Allowable loads have not been increased for wind, seismic, or other factors.
4. For LRFD strengths contact TSN technical services.

\* Maximum allowable load is based on structural testing.

\*\* Maximum allowable load is based on calculations.

**Load Direction**

**\*\*\*StiffClip WC Screw Patterns are shown on next page.**

**Screw Patterns**

**WC350-54**

**WC350-118**

**WC550-XX**

**WC750-XX**

**Nomenclature**

StiffClip WC is designated by multiplying truss web stud depth in inches by 100, then listing material, thickness and length.

**Example:** 3½" truss web stud depth, 54mil steel thickness, 10" long

**Designate:** StiffClip® WC350-54 10"

**Example Details**

# StiffClip® PL

Truss Plate Connector

### Material Composition

ASTM A1003/A1003M Structural Grade 50 (340) Type H, ST50H (ST340H): 50ksi (340MPa) minimum yield strength, 65ksi (450MPa) minimum tensile strength, with ASTM A653/A653M G90 (Z275) hot dipped galvanized coating.

### StiffClip PL Allowable Loads

Plates used to connect framing are generally considered as pinned joints. Load transfers through screw or welded connections between members.

#### Notes:

- All guide holes may not require fasteners. Number and size of fasteners used is based on fastener manufacturer's allowable load data, and is to be verified by designer.
- Guide holes are 0.172" in diameter unless specified.
- Guide holes have 1/2" minimum edge distance and 1" minimum spacing. Spacing will vary based on plate size and specified project requirements.

### Nomenclature

StiffClip PL is available in many different shapes and is designated as width x length - material thickness.

**Example:** 10" wide x 24" long with 68 mil thickness

**Designate:** StiffClip® PL10x24-68

\* Plate sizes vary within each application

\*\*StiffClip PL are typically made to order per project specifications.

### Load Directions

### Notes:

- Design loads are for attachment of StiffClip JH to joist only. Load tables reflect vertical loads (F3).
- StiffClip JH resists vertical loads and web crippling.
- Design loads are based on clip capacity and allowable shear of joist section.
- Screw size and quantity shown is required for StiffClip JH to serve as a joist web stiffener.
- If joist web is larger than clip height then use blocking behind clip for support.
- Allowable loads have not been increased for wind, seismic, or other factors.
- Screws, powder actuated fasteners, or weld attachment may be used to connect StiffClip JH to steel headers or beams. StiffClip JH-68 and heavier can be welded to a supporting steel beam. Powder actuated fasteners into steel are recommended to be 0.157" diameter, and are limited to a maximum of 3/4" substrate thickness.
- For LRFD strengths contact TSN technical services.

Load Direction

### Nomenclature

StiffClip JH is designated by listing the joist depth in inches, followed by the inside flange dimension in inches x 100 (2" flange is standard, and will also service 1 5/8" flange), and the required clip thickness in mils that will accommodate anticipated loads. (see load tables)

**Example:** 6" joist, 2" flange, 2,250 lbs. load  
**Designate:** StiffClip® JH600x200-68

# StiffClip® JC

Joist Connector

### Material Composition

ASTM A1003/A1003M Structural Grade 50 (340) Type H, ST50H (ST340H): 50ksi (340MPa) minimum yield strength, 65ksi (450MPa) minimum tensile strength, with ASTM A653/A653M G90 (Z275) hot dipped galvanized coating.

<b>Max Allowable Clip Load</b>	<b>5,649</b>		<b>5,649</b>		<b>5,649</b>	

### Notes:

- Design loads are for attachment of StiffClip JC to joist only. Load tables reflect vertical loads (F3).
- Design loads consider clip capacity and screw connection to the joist only.
- All guide holes may not require fasteners. Fastener size and quantity determined by designer.
- Torsional effects are considered on screw group for F3 allowable loads. It is assumed that half of the torsional moment is resisted by the connection to the structure and half is resisted by the connection to the joist.
- Allowable loads have not been increased for wind, seismic, or other factors.
- StiffClip JC attachment to the beam or structure must be designed to be greater than or equivalent to the joist attachment.
- For LRFD strengths contact TSN technical services.

### Nomenclature

StiffClip JC is designated by listing the joist depth in inches, followed by the required clip thickness in mils that will accommodate anticipated loads. (see load tables above)

**Example:** 6" joist, 3,000 lbs. load  
**Designate:** StiffClip® JC600-68

### Load Direction

# StiffClip® FS

Floor Strap

### Material Composition

ASTM A1003/A1003M Structural Grade 50 (340) Type H, ST50H (ST340H): 50ksi (340MPa) minimum yield strength, 65ksi (450MPa) minimum tensile strength, with ASTM A653/A653M G90 (Z275) hot dipped galvanized coating.

### StiffClip FS Allowable Loads

StiffClip® FS Recommended Allowable Load (lbs): F3 Tension Load Direction	
Designation	Load
FS125-33	1,163
FS125-43	1,516
FS125-54	1,902
FS125-68	2,396
FS125-97	3,418
FS275-33	2,849
FS275-43	3,713
FS275-54	4,660
FS275-68	5,871
FS275-97	8,374

### Load Direction

### Notes:

1. Design loads are based on strap capacity only. StiffClip FS resists tension forces only.
2. Number of fasteners used is based on fastener manufacturer's allowable load data.
3. Guide holes are located 1/2" from each end, with 3/8" edge distance at 2" o.c. staggered for FS125 and 3/4" edge distance at 2" o.c. staggered for FS275.
4. Allowable loads have not been increased for wind, seismic, or other factors.
5. For LRFD strengths contact TSN technical services.

### Nomenclature

StiffClip FS is designated by the width of the strap in inches followed by strap thickness in mils.

**Example:** 16ga, 2¼" strap, 24" long

**Designate:** StiffClip® FS275-54-24

\* Additional guide holes for fasteners available upon request.

\*\*StiffClip FS are typically made to order per project specifications.

# StiffClip® AL

Multi-Directional Load Resistant Angle

### Material Composition

ASTM A1003/A1003M Structural Grade 50 (340) Type H, ST50H (ST340H): 50ksi (340MPa) minimum yield strength, 65ksi (450MPa) minimum tensile strength, 68mil minimum thickness (14 gauge, 0.0713" design thickness) with ASTM A653/A653M G90 (Z275) hot dipped galvanized coating.

The attachment of StiffClip to the primary structure may be made with PAFs, screw/bolt anchors or weld and is dependent upon the base material (steel or concrete) and the design configuration.

<b>Max Allowable Clip Load</b>	<b>2,458</b>			<b>3,015</b>			<b>6,128</b>		

**\*\*Important notes for StiffClip AL Allowable Load tables continued on next page.**

**Notes:**

1. StiffClip AL is tested to resist loads in horizontal, vertical, and lateral directions.
2. Allowable load tables incorporate eccentric loading of fasteners attached 3/4" from the heel of the clip. Values with welded connection may increase.
3. Allowable loads are for attachment through 3" leg only. Attachment through 1-1/2" leg should be engineered. Reference Material Composition above for calculation purposes.
4. Loads listed reflect force in a single direction. When multiple loads react on the connection, it is the responsibility of the designer to check the interaction of forces.
5. Torsional effects are considered on screw group for F2 and F3 allowable loads. It is assumed that half of the torsional moment is taken by the connection in the short leg and half is taken by the connection in the long leg of StiffClip AL.
6. Allowable loads have not been increased for wind, seismic, or other factors.
7. All guide holes may not require fasteners. Number of fasteneres used is to be determined by designer.
8. Stiffening ribs are not present in StiffClip AL800.
9. For LRFD strengths contact TSN technical services.

**Screw Patterns**

**Nomenclature**

StiffClip AL is available for various stud depths. To specify, multiply stud depth by 100.\*

**Example:** 6" stud depth

**Designate:** StiffClip® AL600

\* The AL362 fits 3 5/8" and 4" member depths

\*\* Stiffening ribs are not present in the AL800.

**Example Details**

StiffClip HE Series

# StiffClip® LS

Spandrel/Multi-Purpose

### Material Composition

ASTM A1003/A1003M Structural Grade 50 (340) Type H, ST50H (ST340H): 50ksi (340MPa) minimum yield strength, 65ksi (450MPa) minimum tensile strength, 68mil minimum thickness (14 gauge, 0.0713" design thickness) with ASTM A653/A653M G90 (Z275) hot dipped galvanized coating.

The attachment of StiffClip to the primary structure may be made with PAFs, screw/bolt anchors or weld and is dependent upon the base material (steel or concrete) and the design configuration.

### Material Analysis

StiffClip® LS Section Properties							
Designation	Area (in <sup>2</sup> )	I <sub>x</sub> (in <sup>4</sup> )	I <sub>y</sub> (in <sup>4</sup> )	R <sub>x</sub> (in)*	R <sub>y</sub> (in)**	S <sub>x</sub> (in <sup>3</sup> )	S <sub>y</sub> (in <sup>3</sup> )
StiffClip® LS < 20" Length	0.322	0.341	0.057	1.029	0.419	0.168	0.046
StiffClip® LS > 20" Length	0.323	0.308	0.055	0.978	0.413	0.198	0.046

### Notes:

1. StiffClip LS resists axial tension and ocmpression loads.
2. Allowable design loads may be calculated based on the section properties shown above.
3. Lengths greater than 20" incorporate a stiffening lip to increase compressive strength.
4. For powder actuated fasteners, fasten within 3/4" from the angle heel centerline of the 1-1/2" leg.

\* Rx = Radius of Gyration about x-x axis.

\*\* Ry = Radius of Gyration about y-y axis.

### Nomenclature

StiffClip LS is available in various lengths. To calculate length for spandrel wall connectors, add stud depth, 3" for attachment to steel (5.5" for attachment to concrete), and the distance of construction tolerance. For other applications, simply designate length (in.) multiplied by 100.

**Example:** 6" stud depth, 4" attachment to structure, 2" tolerance (6+4+2=12)

**Designate:** StiffClip® LS1200

### Example Details

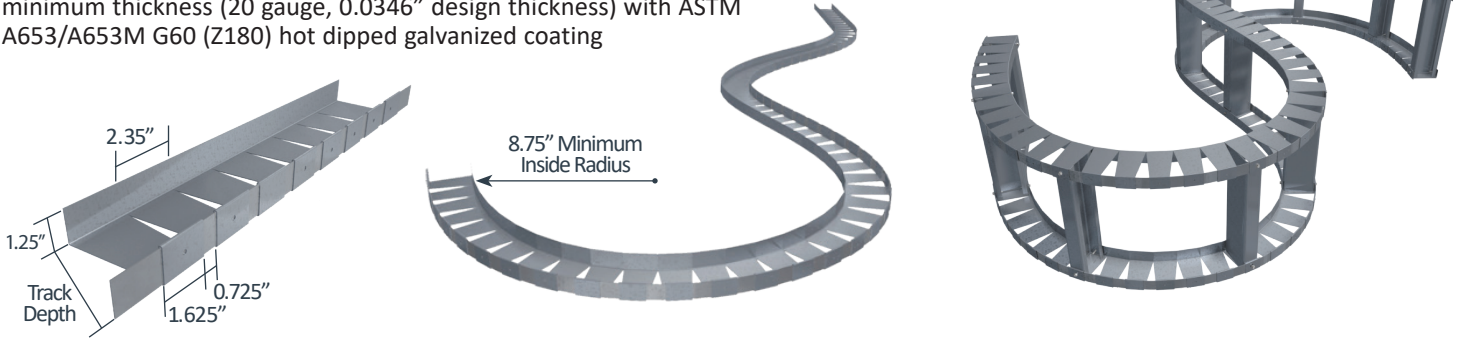

# CircleTrak®

Curved Wall Track

### Material Composition

ASTM A1003/A1003M Structural Grade 33 (230) Type H, ST33H (ST230H): 33ksi (230MPa) minimum yield strength, 45ksi (310MPa) minimum tensile strength, 33mil minimum thickness (20 gauge, 0.0346" design thickness) with ASTM A653/A653M G60 (Z180) hot dipped galvanized coating

			in	mm
CircleTrak®	33	20	0.0346	0.878

### Nomenclature

CircleTrak is available in 10' lengths and is designated by inside web depth x 100, then style (CT), followed by leg length and then material thickness in mils. Circletrak comes in standard 2.5, 3.5, 3.625, 4, 5.5, and 6" web depths.

**Example:** 6" inside web depth

**Designate:** 600CT125-33

### Example Details

# NotchTrak® NT

Rigid Wall Backing & Bridging Alternative

### Material Composition

ASTM A1003/A1003M Structural Grade 50 (340) Type H, ST50H (ST340H): 50ksi (340MPa) minimum yield strength, 65ksi (450MPa) minimum tensile strength, with ASTM A653/A653M G60 (Z180) hot dipped galvanized coating, or equivalent.

Patent Pending

<sup>1</sup>Effective moment of inertia,  $I_x$ , is calculated at a stress level equal to 0.6  $F_y$  (service load level).

### Example Details

NotchTrak® Used For Wall Bridging<sup>1,2</sup>

NotchTrak® Used For Wall Backing

<sup>1</sup> Use NotchTrak in conjunction with flat strap and blocking where applicable

<sup>2</sup> Design screw connection of track to stud for actual design load

**\*\*NotchTrak® allowable load tables continued on next page.**

**Nomenclature**

NotchTrak is manufactured in 12 ft. lengths. NotchTrak is designated by track depth in inches multiplied by 100, followed by type (NT), leg size, mil thickness and notch spacing.

**Example:**

600 (Inside Track Dimension)    NT (NotchTrak)    125 (Leg)    -    43 (Thickness)    -    16oc (Notch Spacing)

\* Special lengths available by request.

<b>Max Allowable Member Load</b>	<b>73</b>	<b>155</b>	<b>324</b>	<b>48</b>	<b>104</b>	<b>219</b>

**Notes:**

1. NotchTrak NT resists weak axis buckling and torsional rotation of members.
2. Table data is based on 1-1/4" track leg, but other leg sizes are available to obtain higher capacities.
3. Meets OSHA and IBC load requirements.
4. Meets OSHPD 2013 CBC Standard Backing Details for Cabinets and Grab Bars (Details ST5.00 and ST5.03).
5. For LRFD strengths contact TSN technical services.

# BackIt®

Rigid Wall Backing

### Material Composition

ASTM A1003/A1003M Structural Grade 50 (340) Type H, ST50H (ST340H): 50ksi (340MPa) minimum yield strength, 65ksi (450MPa) minimum tensile strength, 43mil minimum thickness (18 gauge, 0.0451" design thickness) with ASTM A653/A653M G60 (Z180) hot dipped galvanized coating.

### BackIt Allowable Loads

<b>Maximum Allowable Clip Load</b>	<b>391</b>		<b>1,388</b>		<b>967</b>	

### Notes:

- The recommended allowable loads and moments reported in this table are for the clip and attachment to the stud only. The attachment to the backing material must be designed by a design professional.
  - For LRFD strengths contact TSN technical services.
- \*Additional screws may be added to increase the allowable load. F2 value with (4) #12 screws is 207 lbs.

IBC (International Building Code) and OSHA (Occupational Safety and Health Administration) load requirements include the ability of wall backing to resist a minimum of 200 lbs of concentrated load, or 50 lbs per linear foot in any direction. BackIt satisfies the load requirements in vertical (F3) and horizontal (F2) directions. Extra testing has been done in the rotational (M1) direction. Product test reports are available upon request. Contact TSN Technical Support at (888) 474-4876 for more information.

### Screw Patterns

### Nomenclature

BackIt is designed to be used with studs having flanges up to 1 5/8" wide\*, and is designated BackIt®.  
 \* Custom clips are available by request for use with studs having flanges greater than 1 5/8"  
 \*\*Also Available by Request: End-of-Run BackIt® to finish walls with a flat angle

### Load Direction

# GripClip®

Column/Beam Connector

### Material Composition

ASTM A1003/A1003M Structural Grade 50, Type H, ST50H (ST340H): 50ksi (340MPa) minimum yield strength, 65ksi (450MPa) minimum tensile strength, 33mil minimum thickness (20 gauge, 0.0346" design thickness) with ASTM A653/A653M G90 (Z275) hot dipped galvanized coating.

### Column Fire Resistance Design Numbers:

- (1) Hour Rating is GC001.
  - (1-1/2) Hour Rating is GC001.5.
- See Design Number downloads on TSN GripClip product page.  
 Contact TSN Sales and Engineering for performance evaluation reports.

### Nomenclature

Standard GripClip is shown above with maximum 'grip' of 7/8".  
 Contact TSN Sales and Engineering for increased 'grip' sizes.

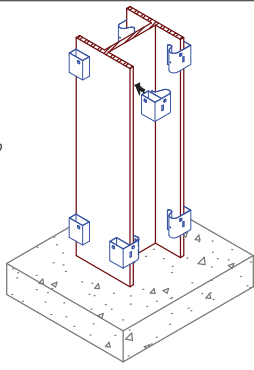

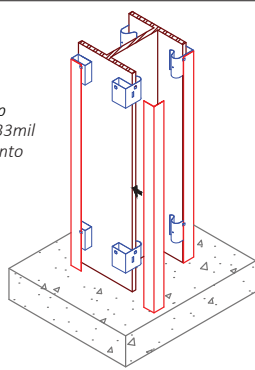

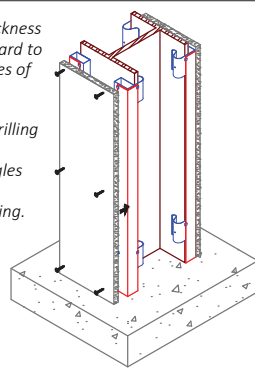

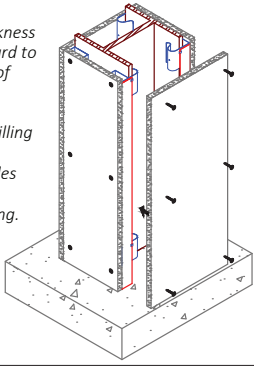

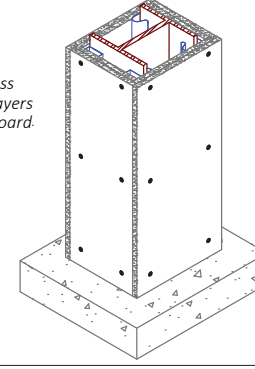

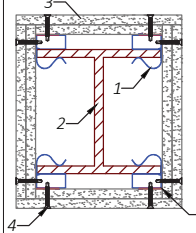

### Example Details

Patent # 8,132,383

## Drywall GripClip® Installation Instructions

### For the Attachment of Gypsum Wallboard to Steel Columns and Beams

 <p><b>GripClip®</b></p> <p>Slide GripClip® onto the flanges of the column or beam at the specified spacing.</p> <p>Face the box shaped portion of GripClip® to the outside of the flanges.</p> 	<p>If required, snap 1-1/2"x1-1/2"-33mil or other angle into GripClip® tabs.</p> 	<p>Trim specified thickness of gypsum wallboard to size for flange sides of column or beam.</p> <p>Attach with self drilling screws through 1-1/2"x1-1/2" angles and GripClip® at the specified spacing.</p> 												
<p>Trim specified thickness of gypsum wallboard to size for web sides of column or beam.</p> <p>Attach with self drilling screws through 1-1/2"x1-1/2" angles and GripClip® at the specified spacing.</p> 	<p>Finish with the specified thickness and number of layers of gypsum wallboard.</p> 	 <p><b>Cross-Section of Finished Assembly:</b></p> <table border="0"> <thead> <tr> <th>Item</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>1.</td> <td>GripClip®</td> </tr> <tr> <td>2.</td> <td>Column or beam</td> </tr> <tr> <td>3.</td> <td>Gypsum wallboard (Thickness and number of layers as specified)</td> </tr> <tr> <td>4.</td> <td>Self-drilling screws</td> </tr> <tr> <td>5.</td> <td>1-1/2"x1-1/2" Angle</td> </tr> </tbody> </table> <p>For Installation, Technical, or Submittal questions, contact TSN at (888) 474-4876 or email us at <a href="mailto:support@steelnetwork.com">support@steelnetwork.com</a></p> <p>Visit <a href="http://www.steelnetwork.com">www.steelnetwork.com</a> and discover the value of each TSN solution.</p>	Item	Description	1. # Common Clip Angle

Common Angle For All Applications

## Material Composition

ASTM A1003/A1003M Structural Grade 50 (345) 50ksi (345MPa) minimum yield strength, 65ksi (450MPa) minimum tensile strength, with ASTM A653/A653M G90 (Z275) hot dipped galvanized coating. Available in 33mil minimum thickness (20 gauge, 0.0346" design thickness), 43mil minimum thickness (18 gauge, 0.0451" design thickness), 54mil minimum thickness (16 gauge, 0.0566" design thickness), 68mil minimum thickness (14 gauge, 0.0713" design thickness), 97mil minimum thickness (12 gauge, 0.1017" design thickness) or 118 mil minimum thickness (10 gauge, 0.1242" design thickness).

## Notes

- The Steel Network is equipped to manufacture cold-formed steel connections of any size and shape. Some examples of common clip angle manufactured and stocked are shown below.
- Most common stocked angles come pre-punched for easier installation, although holes are not required.
- Contact TSN Sales for range of custom clip bend angles and for assistance designing custom products for special applications or requirements. Please allow reasonable time for production of all custom parts.
- Any thickness up to & including 10ga (118mil)
- Structural testing is available upon request.

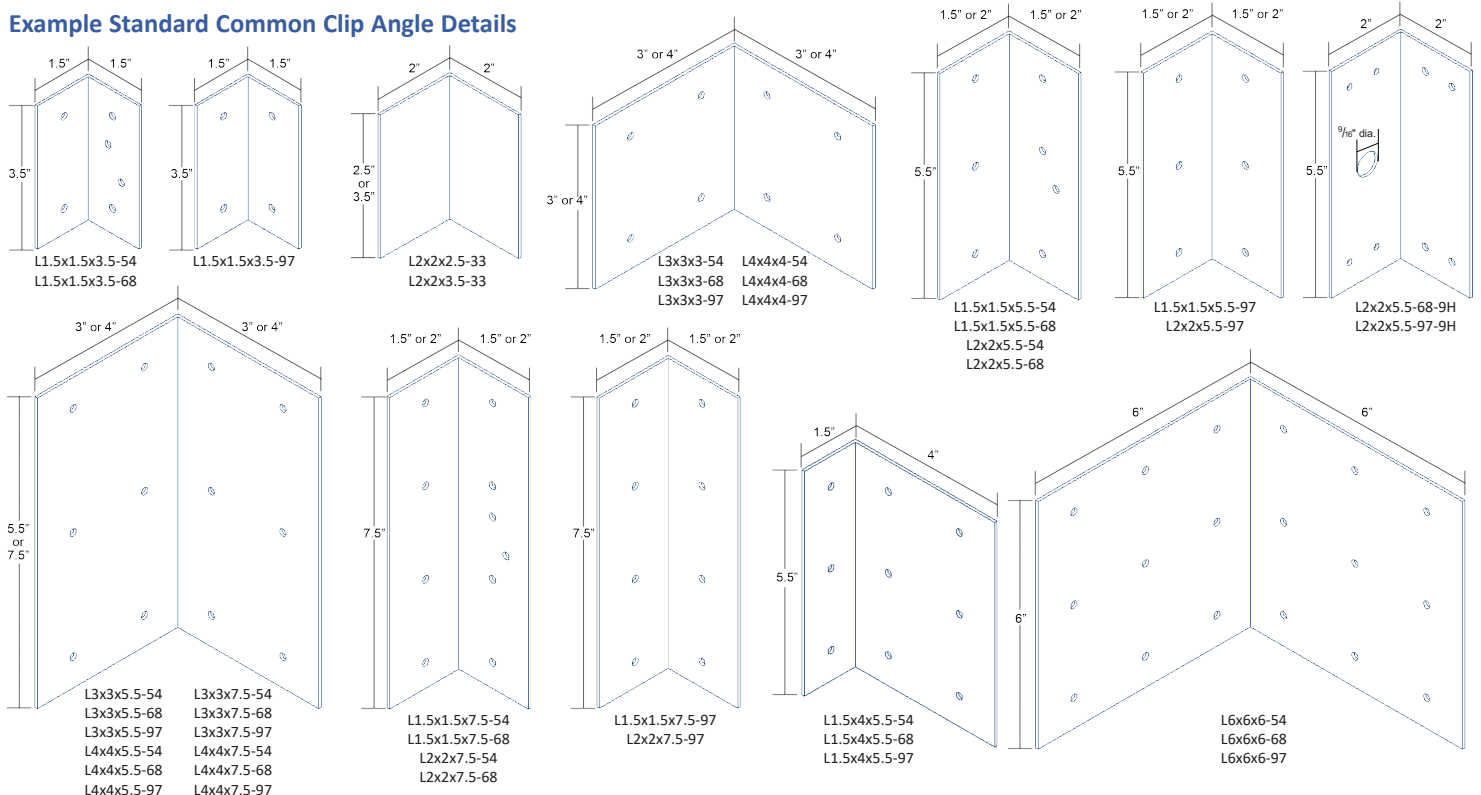

## Nomenclature

Clip angle can be manufactured to any specifications, however TSN stocks some more common sizes. Angle is classified with the letter "L" followed by (Leg A) x (Leg B) x length (inches), then mil thickness.

**Example: Leg A = 3", Leg B = 3", Length = 5 1/2", 54 mil material**  
**Designate: L3x3x5.5-54**

\* Special product drawings are required for all non-standard products.

\* Special product drawing is required for all non-standard products.

## Example Details

Custom VertiClip® SLB

Unique condition brought to TSN by Specialty Engineer. TSN helped design a solution and test & fabricate clips.

Custom VertiClip® Splice (Notched)

Unique condition brought to TSN by Specialty Engineer. TSN helped design a solution and test & fabricate clips.

Custom VertiClip® Splice (Angled)

Unique condition brought to TSN by Specialty Engineer. TSN helped design a solution and test & fabricate clips.

Custom VertiClip® Splice

Connector for parallel wall studs. One stud rigidly attached to wall stud. The other stud accommodates vertical deflection of the primary structural frame.

Custom VertiClip® SLS (extra long)

Retrofit situation where a stud does not run full height, creating a situation where a modified VertiClip SLS was lengthened to bridge a large gap from the structure of 26".

Custom VertiTrak® VTD (VertiClip® SLD with Elongated Slots)

VertiTrak VTD modified to accommodate 4" slots in VertiClip SLD provides an effective, efficient solution for large demising walls typically seen in retail stores and theaters.

	F3	3,639	4,044	6,158

**Notes:**

LStrength values provided are those of the clip only (One clip). Attachment to stud framing and to structure must be evaluated independently. Nominal Strength is calculated as LRFD Strength divided by an average resistance factor of 0.9. Ultimate Strength is the average maximum load obtained from tests. When dynamic analysis is used for blast design, the Nominal Strength may be allowed to be increased by a Static Increase Factor (SIF) and a Dynamic Increase Factor (DIF).

**Background**

Various specifications and design standards allow the use of nominal strength of material when calculating resistance values of components for special blast or seismic design. Beyond the use of nominal strength, some design codes allow the use of an increased nominal strength or an increased expected strength. The Steel Network has developed the following tables to present the LRFD design strength, nominal strength, and ultimate strength for each connector manufactured which can be used in special seismic and blast design and are compatible with the Static and Dynamic Strength Increase factors.

For additional information the full tech note, Strength Tables for Special Seismic and Blast Design of Cold Formed Steel Connections is available at [www.steelnetwork.com/Site/TechnicalNotes](http://www.steelnetwork.com/Site/TechnicalNotes)

**Notes:**

- \* Clip connectors and load directions have their LRFD, nominal, and ultimate strength values all calculated using AISI S100-16 provisions.
- 1. Strength values provided are those of the clip only (One clip). Attachment to stud framing and to structure must be evaluated independently.
- 2. Nominal Strength is calculated as LRFD Strength divided by an average resistance factor of 0.9.
- 3. Ultimate Strength is the average maximum load obtained from tests.
- 4. When dynamic analysis is used for blast design, the Nominal Strength may be allowed to be increased by a Static Increase Factor (SIF) and a Dynamic Increase Factor (DIF).

MidWall® Series (lbs)				
Connector	Load Direction	LRFD Design Strength	Nominal Strength	Ultimate Strength
250MW	M1 (in-lbs)	9,855	10,950	12,288
362MW	M1 (in-lbs)	25,567	28,408	31,104
600MW	M1 (in-lbs)	31,328	34,809	38,112

**Notes:**

1. Strength values provided are those of the clip only (One clip). Attachment to stud framing and to structure must be evaluated independently.
2. Nominal Strength is calculated as LRFD Strength divided by an average resistance factor of 0.9.
3. Ultimate Strength is the average maximum load obtained from tests.
4. When dynamic analysis is used for blast design, the Nominal Strength may be increased by a Static Increase Factor (SIF) and a Dynamic Increase Factor (DIF).

# Building Codes & Fire Ratings

## Building Code Reference

### ICC-ES

The Steel Network assisted the ICC-ES in the development of AC261, "Acceptance Criteria for Connectors Used with Cold-Formed Steel Structural Members," which establishes test protocols and requirements for connections used in cold-formed steel assemblies. TSN provides structural test reports for each connector product which are in compliance with the listed criteria.

#### 2021 IBC (Section 715.2):

**Installation:** A fire-resistant joint system shall be securely installed in accordance with the manufacturer's installation instructions and the listing criteria in or on the joint for its entire length so as not to impair its ability to accommodate expected building movements and to resist the passage of fire and hot gases.

#### 2021 IBC (Section 715.3.1):

**Fire test criteria:** Fire-resistant joint systems shall be tested in accordance with the requirements of either ASTM E1966 or UL 2079.

ICC-ES Evaluation Reports for select VertiClip®, DriftClip® & DriftTrak® products are available. Refer to ICC-ES ESR-2049 at [www.icc-es.org](http://www.icc-es.org) or at [www.steelnetwork.com](http://www.steelnetwork.com)

A New York MEA Acceptance for VertiClip SLD & VertiTrack® VTD is available. Refer to MEA-326-06-M.

### Fire Rating Criteria

Full-height interior partitions are often required to be fire-rated. Fire-resistive joint systems require movement capabilities at head of wall. UL 2079 is a test standard for fire-resistive joint systems and includes requirements for the system's ability to allow building movement. Since the runner track or deflection channel in UL HW-D (Head of Wall-Dynamic) fire-resistive joint system assemblies provide closure to the assembly and must be fire tested for each assembly, the clip components of the assembly must only satisfy the criteria for cyclic movement. The Steel Network's VertiClip® SLD and DriftClip® DSLD series clips both satisfy the criteria for cyclic movement and are classified for use in all UL 2079 rated assemblies with a 1 or 2 hour ratings and up to 1-1/2" of deflection for SLD and 2" of deflection for DSLD. The Steel Network's VertiTrack® VTD, VTX and VT are also classified for use in certain UL HW-D fire-resistive joint system assemblies as listed below.

### UL®-Classified Assemblies

VertiClip® SLD150, SLD250, SLD362, SLD400, SLD600 and SLD800 installed with standard ceiling runners or generic deflection channels are classified for use in all UL 2079 rated Head of Wall-Dynamic joint systems rated for 1 or 2 hours with maximum movement capabilities of 3/4" compression and 3/4" extension.

DriftClip® DSLD362/400, DSLD600 and DSLD800 installed with standard ceiling runners or generic deflection channels are classified for use in all UL 2079 rated Head of Wall-Dynamic joint systems rated for 1 or 2 hours with maximum movement capabilities of 1" compression and 1" extension.

VertiTrack VTD or VTX, Series 250, 362, 400, 600 and 800 consist of VertiClip SLD and SL clips pre-attached to a standard top track. VertiTrack VTD and VTX both allow maximum movement capabilities of 3/4" compression and 3/4" extension and are classified for use in the following UL HW-D joint system details:

HW-D-0003, HW-D-0024, HW-D-0025, HW-D-0036, HW-D-0042, HW-D-0043, HW-D-0044, HW-D-0045, HW-D-0046, HW-D-0047, HW-D-0048, HW-D-0049, HW-D-0054, HW-D-0062, HW-D-0063, HW-D-0066, HW-D-0067, HW-D-0068, HW-D-0069, HW-D-0071, HW-D-0072, HW-D-0073, HW-D-0076, HW-D-0077, HW-D-0082, HW-D-0083, HW-D-0084, HW-D-0085, HW-D-0087, HW-D-0089, HW-D-0091, HW-D-0102, HW-D-0106, HW-D-0152, HW-D-0154, HW-D-0160, HW-D-0162, HW-D-0167, HW-D-0184, HW-D-0185, HW-D-0186, HW-D-0190, HW-D-0193, HW-D-0209, HW-D-0218, HW-D-0246, HW-D-0256, HW-D-0259, HW-D-0263, HW-D-0271, HW-D-0272, HW-D-0275, HW-D-0277, HW-D-0278, HW-D-0280, HW-D-0293, HW-D-0299, HW-D-0310, HW-D-0313, HW-D-0321, HW-D-0322, HW-D-0324, HW-D-0341, HW-D-0342\*, HW-D-0353, HW-D-0356, HW-D-0357, HW-D-0358, HW-D-0363, HW-D-0365, HW-D-0368, HW-D-0370,

HW-D-0371, HW-D-0401\*, HW-D-0404, HW-D-0420, HW-D-0421, HW-D-0453, HW-D-0455, HW-D-0460, HW-D-0461, HW-D-0462, HW-D-0463, HW-D-0466, HW-D-0468, HW-D-0470, HW-D-0475, HW-D-0477, HW-D-0483, HW-D-0491, HW-D-0526, HW-D-0527, HW-D-0532, HW-D-0545, HW-D-0639, HW-D-0642\*, HW-D-0644\*, HW-D-0645\*, HW-D-0646\*, HW-D-0687, HW-D-0689, HW-D-0695, HW-D-0696

The list is updated as UL classifies new assemblies. Please visit [www.portal.steelnetwork.com/light-steel-framing-fire-rated-details](http://www.portal.steelnetwork.com/light-steel-framing-fire-rated-details) and click on the UL link for a complete list of VertiTrack HW-D classified fire rated construction systems.

# Terms, Conditions & Limited Warranty

For All Products Manufactured by The Steel Network, Inc.

## Product Use

Products in this catalog are designed and manufactured for the specific purposes shown, and should not be used in other applications unless approved by a qualified design professional. All modifications to products or changes in installation procedures should be made by a qualified design professional. The performance of such modified products or altered installation procedures is the sole responsibility of the design professional or installation contractor. The installation contractor and/or qualified design professional are responsible for installing all products in accordance with relevant specifications and building codes.

Customers modifying products or installation procedures, or designing Custom products for fabrication by The Steel Network, Inc. ("TSN") shall, regardless of specific instructions to the user, indemnify, defend, and hold TSN harmless for any and all claimed loss or damage occasioned in whole or in part by Custom or modified products or installation procedures.

Loads published on TSN's website and current product catalogs are for the described specific applications of properly installed products. Modifications to TSN products, improper loading or installation procedures, or deviations from recommended applications will affect TSN products' load-carrying capacities. TSN products are fabricated from hot-dipped galvanized steel for corrosion protection but will corrode and lose load-carrying capacity if exposed to salt air, corrosive fire-retardant chemicals, fertilizers, or other substances that may adversely affect steel or its galvanized coating. The current editions of TSN's catalogs and load tables published on this website may reflect changes in the allowable loads and configurations of some of TSN's products. This information supersedes information in earlier catalogs or technical reports. All earlier catalogs or technical reports should be discarded and reference made exclusively to the versions available at <http://www.steelnetwork.com/Site/Catalogs>. TSN may correct any clerical or typographical errors. All sales are subject to TSN's standard terms and conditions of sale.

## Limited Warranty

TSN warrants its products to be free from defects in material or workmanship at the time of shipment. TSN standard catalog products are warranted for adequacy of design when used in accordance with design limits in this catalog and properly specified and installed. TSN products shall not be substituted with non-TSN products if it is part of a system. Substitution of a TSN product will immediately void any warranty claim made by Purchaser. This warranty excludes uses not in compliance with specific applications and installation procedures set forth in this catalog. Warranty claims must be made by Purchaser in writing within ninety (90) days of receipt of the products.

All warranty obligations of TSN shall be limited, at the sole discretion of TSN, to repair or replace the defective product(s). These remedies shall constitute TSN's sole obligation and sole remedy of purchaser under this warranty. In no event will TSN be responsible for incidental, consequential, indirect, exemplary, special, consequential, or punitive damages, or other losses or damages however caused, including, but not limited to, installation costs, lost revenue or lost profits. TSN's liability for damages shall in no event exceed the applicable portion of the purchase price for defective product(s).

Product defects that arise from acts of God, accidents, misuse, misapplication, improper installation, storage damage, negligence, or modification to product(s) or its components are specifically excluded from this warranty. Product defects that arise from Purchaser providing incorrect information to TSN, including but not limited to incorrect specifications such as incorrect dimensions, designs and/or loads, are also specifically excluded from this warranty. TSN does not authorize any person or party to assume or create for it any other obligation or liability in connection with Products except as set forth herein.

This Warranty is expressly in lieu of all other warranties, expressed or implied, including any warranties of merchantability or fitness for a particular purpose, all such other warranties being hereby expressly excluded.

## Patented Technology
